48	RWX	RX_BAD_BUS_LANE_ERR_CNTR_DIS_CLR: Disable clearing of the bad bus lane error counter (aka counter1) when the next CRC/ECC error comes in on a new lane.
49:55	ROX	Reserved field. (Access type is rx_bad_bus_lane_err_cntr_ro_signal)
56	RO	constant=0b0
57:63	ROX	Reserved field. (Access type is rx_last_bad_bus_lane_ro_signal)

Register Name	*RX Spare Lane Signaling Mode Register*
Mnemonic	DMI.RX.RXCTL.RX_CTL_REGS.RX_SLS_MODE_PG
Address	800878000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RWX	RX_SLS_DISABLE: Disables receiving & decoding of SLS commands.

Bits	SCOM	Field Mnemonic: Description
49	RWX	TX_SLS_DISABLE: If set, the SLS command being sent will always just be a NOP. To truly disable the full SLS logic path, also do some combination of the following (depending on what exactly you are trying to do): set the rx_sls_disable, manually override the tx_snd_sls_cmd_gcrmsg per pack registers (if you do not also disable the various sending SMs, though, this will eventually get overwritten), set tx_sls_lane_val_gcrmsg to 0 (if there is no valid TX SLS lane, no SLS command will get sent on it), and/or disable the recal, repair, recovery SMs (rx_dyn_recal_suspend, rx_dyn_rpr_disable, rx_sls_rcvy_disable) that initiate the sending of SLS commands.
50:51	RWX	RX_SLS_CNTR_TAP_PTS: How Long the SLS RX Command Needs to be Stable for.. Need to make sure this scales with tx_dyn_recal_interval_timeout & status_rpt_timeout. 0b00 = EDI - 16 c8 clks; EI4 - 32 c4 clks 0b01 = EDI - 32 c8 clks; EI4 - 64 c4 clks 0b10 = EDI - 64 c8 clks; EI4 - 128 c4 clks 0b11 = EDI - 128 c8 clks; EI4 - 256 c4 clks Values: TAP1=>0b00 TAP2=>0b01 TAP3=>0b10 TAP4=>0b11
52:53	RWX	RX_NONSLS_CNTR_TAP_PTS: How Long a Non-SLS RX Command Needs to be Stable for (to know we have switched from an SLS command to data).. Need to make sure this scales with tx_dyn_recal_interval_timeout & status_rpt_timeout. 0b00 = EDI - 32 c8 clks; EI4 - 64 c4 clks 0b01 = EDI - 64 c8 clks; EI4 - 128 c4 clks 0b10 = EDI - 128 c8 clks; EI4 - 256 c4 clks 0b11 = EDI - 256 c8 clks; EI4 - 512 c4 clks Values: TAP1=>0b00 TAP2=>0b01 TAP3=>0b10 TAP4=>0b11
54	RWX	RX_SLS_ERR_CHK_RUN: Run SLS error check counter.
55:63	RO	constant=0b000000000

Register Name	***RX Training State Start Register***
Mnemonic	DMI.RX.RXCTL.RX_CTL_REGS.RX_TRAINING_START_PG
Address	800880000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RWX	RX_START_WIRETEST: When this register is written to a 1 the training state machine will run the wiretest portion of the training states..
49	RWX	RX_START_DESKEW: When this register is written to a 1 the training state machine will run the deskew portion of the training states..
50	RWX	RX_START_EYE_OPT: When this register is written to a 1 the training state machine will run the data eye optimization portion of the training states..
51	RWX	RX_START_REPAIR: When this register is written to a 1 the training state machine will run the static lane repair portion of the training states..
52	RWX	RX_START_FUNC_MODE: When this register is written to a 1 the training state machine will run the transition to functional data portion of the training states..

Bits	SCOM	Field Mnemonic: Description
53	RWX	RX_START_BIST: Set bit to run BIST and perform the required TX FIFO init, RX CU PLL lock, RX FIFO init, and offset calibration in the BIST helper state machine. The RX BIST state machine is enabled through a GCR message to the rx_bist_en register field.JGR 0b0 = Idle 0b1 = Start RX BIST Values: IDLE=>0b0 EN_RX_BIST=>0b1
54	RWX	RX_START_OFFSET_CAL: Set bit to run offset cal and the required TX FIFO init, RX CU PLL lock, and RX FIFO init through the BIST helper state machine.JGR 0b0 = Idle 0b1 = Start Offset Cal Values: IDLE=>0b0 OCAL=>0b1
55	RWX	RX_START_WT_BYPASS: Set bit to run wiretest bypass and the required TX FIFO initialization through the BIST helper state machine.JGR 0b0 = Idle 0b1 = Start Wiretest Bypass Values: IDLE=>0b0 WTBYP=>0b1
56:63	RO	constant=0b00000000 Values: IDLE=>0b0 WTBYP=>0b1

Register Name	***RX Training State Status Register***
Mnemonic	DMI.RX.RXCTL.RX_CTL_REGS.RX_TRAINING_STATUS_PG
Address	800888000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RWX	RX_WIRETEST_DONE: When this bit is read as a 1, the wiretest training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state..
49	RWX	RX_DESKEW_DONE: When this bit is read as a 1, the deskew training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state..
50	RWX	RX_EYE_OPT_DONE: When this bit is read as a 1, the eye optimization training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state..
51	RWX	RX_REPAIR_DONE: When this bit is read as a 1, the static lane repair training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state..
52	RWX	RX_FUNC_MODE_DONE: When this bit is read as a 1, the transition to functional data training state has completed. Check the corresponding rx_ts_*_failed register field for the pass/fail status of this training state..
53	RWX	RX_BIST_STARTED: When this bit is read as a 1, the RX BIST helper initializations have completed and a GCR enable message has been sent to RX BIST.JGR
54	RWX	RX_OFFSET_CAL_DONE: When this bit is read as a 1, offset cal has completed.JGR
55	RWX	RX_WT_BYPASS_DONE: When this bit is read as a 1, wiretest bypass has completed.JGR

Bits	SCOM	Field Mnemonic: Description
56	RWX	RX_WIRETEST_FAILED: When this bit is read as a 1, the wiretest training state encountered an error..
57	RWX	RX_DESKEW_FAILED: When this bit is read as a 1, the deskew training state encountered an error..
58	RWX	RX_EYE_OPT_FAILED: When this bit is read as a 1, the eye optimization training state encountered an error..
59	RWX	RX_REPAIR_FAILED: When this bit is read as a 1, the static lane repair training state encountered an error..
60	RWX	RX_FUNC_MODE_FAILED: When this bit is read as a 1, the transition to functional data training state encountered an error..
61	RWX	RX_START_BIST_FAILED: When this bit is read as a 1, the RX CU PLL failed to lock and BIST was not started. (This bit is set along with rx_wt_bypass_failed and rx_offset_cal_failed). JGR
62	RWX	RX_OFFSET_CAL_FAILED: When this bit is read as a 1, the RX CU PLL failed to lock and offset cal was not performed. (This bit is set along with rx_wt_bypass_failed and rx_start_bist_failed). JGR
63	RWX	RX_WT_BYPASS_FAILED: When this bit is read as a 1, the RX CU PLL failed to lock. Wiretest bypass did not complete. (This bit is set along with rx_offset_cal_failed and rx_start_bist_failed). JGR

Bits	SCOM	Field Mnemonic: Description
48:51	RWX	RX_FIFO_INITIAL_L2U_DLY: RX FIFO Initial Load to Unload Delay. For setting X, the latency is 4*X to 4*X+4 UI. Default is 16-20 UI.
52:55	RWX	RX_FIFO_FINAL_L2U_DLY: RX FIFO Final Load to Unload Delay. For setting X, the latency is 4*X to 4*X+4 UI. Default is 8-12 UI.
56:59	RWX	RX_FIFO_MAX_DESKEW: NO LONGER USED--REMOVE for DD2 design.
60:61	RWX	RX_FIFO_FINAL_L2U_MIN_ERR_THRESH: RX FIFO error threshold used to qualify the minimum load to unload delay as bad, which is used as the point of reference for adjusting to the final load to unload delay. Note that the errors are accumulated across the entire clock group for a length of time selected by rx_eo_final_l2u_timeout_sel. 0b00 = 8 errors 0b01 = 16 errors 0b10 = 128 errors 0b11 = 255 errors Values: TAP0=>0b00 TAP1=>0b01 TAP2=>0b10 TAP3=>0b11
62:63	RO	constant=0b00 Values: TAP0=>0b00 TAP1=>0b01 TAP2=>0b10 TAP3=>0b11

Register Name	*RX Per-Group Training FIR Error Register*
Mnemonic	DMI.RX.RXCTL.RX_CTL_REGS.RX_FIR_TRAINING_PG
Address	800900000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RWX	RX_PG_FIR_TRAINING_ERROR: This field is now defunct and is permanently masked in the rx_fir_training_mask_pg FIR isolation register.
49	RWX	RX_PG_FIR_STATIC_SPARE_DEPLOYED: A spare lane has been deployed during training to heal a lane that was detected as bad. rx_Static_Spare_Deployed (SSD) will be set after the repair training step if during training either wiretest, deskew, eyeopt or repair has detected one or more bad lanes have been detected. The rx_bad_lane_enc_gcrmsg_pg register can be read to isolate which lane(s) were healed and the rx_bad_lane.
50	RWX	RX_PG_FIR_STATIC_MAX_SPARES_EXCEEDED: A lane has been detected as bad during training but there are no spare lanes available to heal it. THIS FIR WILL NOT BE SET UNTIL THE REPAIR TRAINING STEP HAS BEEN RUN. THIS IS A CATASTROPHIC FAILURE FOR THE BUS WHEN IN MISSION MODE BUT ALL TRAINING STEPS WILL STILL BE RUN ON WHATEVER GOOD LANES THERE ARE. rx_static_max_spares_exceeded will be set if wiretest, deskew, eyeopt or repair find the excessive number of bad lanes.
51	RWX	RX_PG_FIR_DYNAMIC_REPAIR_ERROR: A Dynamic Repair error has occurred. The Recal Error FFDC registers should be read to help isolate to a particular piece of logic.
52	RWX	RX_PG_FIR_DYNAMIC_SPARE_DEPLOYED: A spare lane has been deployed by ECC/CRC logic to heal a lane that was detected as bad. The rx_bad_lane_enc_gcrmsg_pg register can be read to isolate which lane(s) were healed.
53	RWX	RX_PG_FIR_DYNAMIC_MAX_SPARES_EXCEEDED: A lane has been detected as bad by ECC/CRC logic but there are no spare lanes to heal it. THIS IS A CATASTROPHIC FAILURE FOR THE BUS.
54	RWX	RX_PG_FIR_RECAL_ERROR: A Recalibration Error has occurred. The Recal Error FFDC registers should be read to help isolate to a particular piece of logic.
55	RWX	RX_PG_FIR_RECAL_SPARE_DEPLOYED: A spare lane has been deployed during Recal to heal a lane that was detected as bad. The rx_bad_lane_enc_gcrmsg_pg register can be read to isolate which lane(s) were healed.
56	RWX	RX_PG_FIR_RECAL_MAX_SPARES_EXCEEDED: A lane has been detected as bad during Recal but there are no spare lanes to heal it. THIS IS A CATASTROPHIC FAILURE FOR THE BUS.
57	RWX	RX_PG_FIR_TOO_MANY_BUS_ERRORS: More than one lane has been detected as having too many errors during functional operation. THIS IS A CATASTROPHIC FAILURE FOR THE BUS.

0:47	RO	constant=0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	RWX	RX_LANE_BAD_VEC_0_15: Lanes found bad by HW (status) or method to force lane bad from software (control).to be clear, the bad_lane vector is only updated during training. It will not reflect bad lanes found post training during dynamic repair or dynamic recal. For that, you need to read the [rx,tx]_bad_lane[1,2]_gcrmsg registers. To calculate what you want to know, you need five registers:. rx_bad_lane1_gcrmsg. rx_bad_lane2_gcrmsg. rx_bad_lane_code_gcrmsg. rx_sls_lane_gcrmsg. rx_wtr_max_bad_lanes. In general, if the spares deployed FIR goes on, and the bad_lane_code is a 1, then the newly spared lane resides in the rx_bad_lane1_gcrmsg register. If the spares deployed FIR goes on, and the bad_lane_code is a 2, then the newly spared lane resides in the rx_bad_lane2_gcrmsg register. If the spares deployed FIR goes on, and the bad_lane_code is a 3, then the newly spared lane resides in the rx_sls_lane_gcrmsg register. That might be enough information for what you want to know, trying to keep the answer very general. At the moment, this case where both the spare deployed and max spares exceeded both come on at the same time, is for the EDI where a third bad lane has been found and we have chosen to use the SLS lane as a third spare. EDI normally only has two spare lanes. In that case, I first set the spare deployed FIR as the SLS lane is being used as a third spare. But then a few cycles later, I set the max spares exceeded because I no longer have an SLS lane and cant finish my SLS repair handshake..

Bits	SCOM	Field Mnemonic: Description
48	RWX	TX_CLK_PDWN: Used to disable the TX clock and put it into a low power state. 0b0 = Clk Enabled (default) 0b1 = Clk Disabled Values: CLK_ENABLE=>0b0 CLK_DISABLE=>0b1
49	RWX	TX_CLK_INVERT: Used to invert the polarity of the clock. 0b0 = Normal Clk Polarity (default) 0b1 = Invert Clk Values: NORMAL_CLK=>0b0 INVERT_CLK=>0b1
50:51	RWX	TX_CLK_QUIESCE_P: Used to force the output of the positive differential leg of the clock lane to a particular value. Note that the 0 and 1 settings for EDI are for lab characterization only, and the circuits are not deemed to have the proper drive strength in those modes to meet production level quality. 0b00 = Functional Data (default) 0b01 = Quiesce Clock Lane to a Static 0 value 0b10 = Quiesce Clock Lane to a Static 1 value 0b11 = Tri-State Clock Lane Output Values: FUNCTIONAL=>0b00 QUIESCE_TO_0=>0b01 QUIESCE_TO_1=>0b10 QUIESCE_TO_Z=>0b11
52:53	RWX	TX_CLK_QUIESCE_N: Used to force the output of the negative differential leg of the clock lane to a particular value. Note that the 0 and 1 settings for EDI are for lab characterization only, and the circuits are not deemed to have the proper drive strength in those modes to meet production level quality. 0b00 = Functional Data (default) 0b01 = Quiesce Clock Lane to a Static 0 value 0b10 = Quiesce Clock Lane to a Static 1 value 0b11 = Tri-State Clock Lane Output Values: FUNCTIONAL=>0b00 QUIESCE_TO_0=>0b01 QUIESCE_TO_1=>0b10 QUIESCE_TO_Z=>0b11
54	RWX	TX_CLK_DDR_MODE: Used to select TX clock QDR mode or DDR mode. 0b0 = QDR mode (default) 0b1 = DDR mode Values: QDR=>0b0 DDR=>0b1
55:63	RO	constant=0b000000000 Values: QDR=>0b0 DDR=>0b1

Register Name	***TX Per-Group Spare Mode Register***
Mnemonic	DMI.TX.TXCTL.TX_CTL_REGS.TX_SPARE_MODE_PG
Address	800C0C000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48	RWX	TX_PG_SPARE_MODE_0: Per-group spare mode latch
49	RWX	TX_PG_SPARE_MODE_1: Per-group spare mode latch
50	RWX	TX_PG_SPARE_MODE_2: Per-group spare mode latch
51	RWX	TX_PG_SPARE_MODE_3: Per-group spare mode latch
52	RWX	TX_PG_SPARE_MODE_4: Per-group spare mode latch
53	RWX	TX_PG_SPARE_MODE_5: Per-group spare mode latch
54	RWX	TX_PG_SPARE_MODE_6: Per-group spare mode latch
55	RWX	TX_PG_SPARE_MODE_7: Per-group spare mode latch
56:63	RO	constant=0b00000000

Register Name	***TX Mode Register***
Mnemonic	DMI.TX.TXCTL.TX_CTL_REGS.TX_MODE_PG
Address	800C1C000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:52	RWX	TX_MAX_BAD_LANES: Static Repair, Dynamic Repair & Recal max number of bad lanes per TX bus (NOTE: should match RX side).
53	RWX	TX_MSBSWAP: Used to enable end-for-end or msb swap of TX lanes. For example, lanes 0 and N-1 swap, lanes 1 and N-2 swap, etc. 0b0 = No swap (default) 0b1 = End-for-end swap mode Values: NOMSBSWAP=>0b0 MSBSWAP=>0b1
54	RWX	TX_PDWN_LITE_DISABLE: Disables the power down lite feature of unused spare lanes (generally should match rx_pdwn_lite_disable).
55:63	RO	constant=0b000000000

Register Name	***TX Reset Control Action Register (RCAR)***
Mnemonic	DMI.TX.TXCTL.TX_CTL_REGS.TX_RESET_ACT_PG
Address	800C44000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48	NCX	Reserved field. (Access type is tx_reset_cfg_ena_wo_pulse_slow_signal)
49:61	RO	constant=0b0000000000000

Bits	SCOM	Field Mnemonic: Description
62	RWX	TX_CLR_PAR_ERRS: Clear All TX Parity Error Latches. Toggle this field 0->1->0 to clear all TX parity error latches.
63	RWX	TX_FIR_RESET: FIR Reset. Toggle this field 0->1->0 to reset all TX FIR related latches including parity error latches, including the parity error latches.

Register Name	***TX BIST CLK Status Register***
Mnemonic	DMI.TX.TXCTL.TX_CTL_REGS.TX_BIST_STAT_PG
Address	800C4C000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49	RWX	TX_CLK_BIST_ERR: Indicates a TXBIST clock side error occurred.. JGR 0b0 = No Error 0b1 = A clock side error has has been found Values: NO_ERROR=>0b0 ERROR=>0b1
50	RO	constant=0b0 Values: NO_ERROR=>0b0 ERROR=>0b1
51	ROX	Reserved field. (Access type is tx_clk_bist_done_ro_signal) Values: NO_ERROR=>0b0 ERROR=>0b1
52:63	RO	constant=0b000000000000 Values: NO_ERROR=>0b0 ERROR=>0b1

Register Name	***TX Per-Group FIR Error Source-Isolation Register***
Mnemonic	DMI.TX.TXCTL.TX_CTL_REGS.TX_FIR_PG
Address	800C54000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:55	RWX	TX_PG_FIR_ERRS: IOTK ALIAS: A 1 in this field indicates that a register or state machine parity error has occurred in the per-group TXCTL logic.
56:62	RO	constant=0b0000000
63	RWX	TX_PL_FIR_ERR: IOTK ALIAS: A 1 in this field indicates that a register or state machine parity error has occurred in per-lane logic.

Register Name	*TX Per-Group FIR Error Source-Isolation Register*
Mnemonic	DMI.TX.TXCTL.TX_CTL_REGS.TX_FIR_MASK_PG
Address	800C5C000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:55	RWX	TX_PG_FIR_ERRS_MASK: FIR mask for register or state machine parity checkers in per-group TXCTL logic. A value of 1 masks the error from generating a FIR error.. Bit0: par_err_mask_txctl_regs. Bit1: par_err_mask_gcr_buff. Bit2: Reserved.. Bit3: par_err_mask_tx_stt_rpr_snd_msg_state.. Bit4: par_err_mask_gcrs_ld_state. Bit5: par_err_mask_gcrs_unld_state. Bit6: Reserved.. Bit7: Reserved.
56:62	RO	constant=0b0000000
63	RWX	TX_PL_FIR_ERR_MASK: IOTK ALIAS: FIR mask for the per-lane TX Register checker.

Register Name	*TX Per-Group FIR Error Injection Register*
Mnemonic	DMI.TX.TXCTL.TX_CTL_REGS.TX_FIR_ERROR_INJECT_PG
Address	800C64000201043F (SCOM)
Attributes	
Description

Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:50	RWX	TX_IREF_BC: Bias Code for the Iref macros on the TX side. All eight 3 bit codes enable current out. The CML voltage swings of the output current will vary with this code.. SMC
51:63	RO	constant=0b0000000000000

Register Name	*TX Minikerf Control Register*
Mnemonic	DMI.BUSCTL.BUS_CTL_REGS.TX_MINIKERF_PB
Address	800F3C000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	TX_MINIKERF: TX Minikerf Cntl Reg: . Bits (3:13) are only used when (0:2)=001. Bits (14:15) are spare. (0:2) is level 1 steering, . (0:2)=000 - reserved . (0:2)=001 - use bits (3:5) level 2 steering, (6:13) dac controls, (14:15) spare . (0:2)=010 - impedance control termref_mk_probe_ana(0:1) except on the memory buffer which uses rx_minikerf_pg . (0:2)=011 - reserved . (0:2)=100 - reserved . (0:2)=101 - tx tank pll clk on c4 pads except in the memory buffer, which has dedicated c4 pads from the clk_4t1sst_drvr.(0:2)=110 - reserved.(0:2)=111 - reserved. SMC

Register Name	*TX Initfile Version Register*
Mnemonic	DMI.BUSCTL.BUS_CTL_REGS.TX_INIT_VERSION_PB
Address	800F44000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	TX_INIT_VERSION: Initfile Version. This field is used to hold the initfile version for debug purposes.

Register Name	*TX Scratch Register*
Mnemonic	DMI.BUSCTL.BUS_CTL_REGS.TX_SCRATCH_REG_PB
Address	800F4C000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:63	RWX	TX_SCRATCH_REG: Scratch Register. This field is used to enable FW procedures to communicate.

Register Name	*Per-Bus BUSCTL FIR Error Reset Register*
Mnemonic	DMI.BUSCTL.BUS_CTL_REGS.RX_FIR_RESET_PB
Address	800F80000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:61	RO	constant=0b0000000000000000000000000000000000000000000000000000000000000000
62	RWX	RX_PB_CLR_PAR_ERRS: Clear All RX Parity Error Latches. Toggle this field 0->1->0 to clear parity error latches in the BUSCTL logic.
63	RWX	RX_PB_FIR_RESET: FIR Reset. Toggle this field 0->1->0 to reset the BUSCTL logic FIR related latches, including the isolation and parity error latches.

Register Name	*Per-Bus FIR Error Source-Isolation Register*
Mnemonic	DMI.BUSCTL.BUS_CTL_REGS.RX_FIR_PB
Address	800F88000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:57	RWX	RX_PB_FIR_ERRS: IOTK ALIAS: A 1 in this field indicates that a register or state machine parity error has occurred in per-bus logic.
58:63	RO	constant=0b000000

Register Name	*Per-Bus FIR Error Source-Isolation Mask Register*
Mnemonic	DMI.BUSCTL.BUS_CTL_REGS.RX_FIR_MASK_PB
Address	800F90000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:57	RWX	RX_PB_FIR_ERRS_MASK: IOTK ALIAS: FIR mask for rx_fir_pb errors.
58:63	RO	constant=0b000000

Register Name	*Per-Bus FIR Error Injection Register*
Mnemonic	DMI.BUSCTL.BUS_CTL_REGS.RX_FIR_ERROR_INJECT_PB
Address	800F98000201043F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:57	RWX	RX_PB_FIR_ERRS_INJ: IOTK ALIAS: RX Per-Bus Parity Error Injection. Allows injection of non-destructive parity errors in either register or statemachine latch banks. The register or state value is not affected.
58:63	RO	constant=0b000000

5. PCB Slave 3: MEM Chiplet

The memory buffer registers are listed alphabetically by mnemonic in the following address table.

The memory buffer registers are listed in the following tables.

Register Name	*GP Register 0*
Mnemonic	TCM.GP0
Address	0000000003000000 (PCB) 0000000003000004 (PCB1) 0000000003000005 (PCB2)
Attributes	
Description	

Bits	PCB	PCB1	PCB2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	TC_UNIT_ABSTCLK_MUXSEL_DC: Select ABIST clock source for Arrays on Chiplet Boundary. When set to 1, clocks where used from Chiplet with ABIST, Reset(0b0)
1	RWX	WOX_AND	WOX_OR	TC_UNIT_SYNCCLK_MUXSEL_DC: Select the sync clock for async latches (init value 1), Reset(0b1)
2	RWX	WOX_AND	WOX_OR	TC_GPIO_FLUSHMODE_INH_DC_OUT: Prevent plats from going into flush mode (init value 1), Reset(0b1)
3	RWX	WOX_AND	WOX_OR	TC_GPIO_FORCEALIGN: Force align signal to be sent (init value 1, drop before dropping flushmode_inh), Reset(0b1)
4	RWX	WOX_AND	WOX_OR	TC_GPIO_AVP_MODE_DC_OUT: Enable AVP mode, Reset(0b0)
5	RWX	WOX_AND	WOX_OR	TC_ASIC_CORE_FORCETOKNOWN_DC: LBIST: Force known value on analog outputs; DDRN, Reset(0b0)
6	RWX	WOX_AND	WOX_OR	TC_GPIO_CC_SCAN_DIS_DC_B_OUT: Disable scan - set output of scan chain to zero, Reset(0b0)
7	RWX	WOX_AND	WOX_OR	TC_SKIT_MODE_BIST_DC: Enable Skitter measuring during Bist, Reset(0b0)
8	RWX	WOX_AND	WOX_OR	TC_GPIO_LBIST_EN_DC_OUT: LBIST mode, Reset(0b0)
9	RWX	WOX_AND	WOX_OR	TC_UNIT_LBIST_AC_MODE_DC: LBIST AC mode, Reset(0b0)
10	RWX	WOX_AND	WOX_OR	TC_UNIT_LBIST_ARY_WRT_THRU_DC: Array write thru mode - set Array in bypass mode, Reset(0b0)
11	RWX	WOX_AND	WOX_OR	TC_ABIST_MODE_DC: Set during ABIST, Reset(0b0)
12	RWX	WOX_AND	WOX_OR	TC_GPIO_ABIST_START_TEST_DC_OUT: Set to start ABIST testing, Reset(0b0)
13	RWX	WOX_AND	WOX_OR	NOT_USED0: not used, Reset(0b0)
14	RWX	WOX_AND	WOX_OR	TC_UNIT_ATPG_EN_DC: ATPG mode, Reset(0b0)
15	RWX	WOX_AND	WOX_OR	TC_GPIO_SCAN_PROTECT_DC_OUT: Scan protection enable (init value 1), Reset(0b1)
16	RWX	WOX_AND	WOX_OR	TC_ASIC_CORE_FORCETOKNOWN2_DC: LBIST: Force known value on analog outputs; DDRS, Reset(0b1)
17	RWX	WOX_AND	WOX_OR	NOT_USED2: not used, Reset(0b0)
18	RWX	WOX_AND	WOX_OR	NOT_USED3: not used, Reset(0b0)
19	RWX	WOX_AND	WOX_OR	NOT_USED4: not used, Reset(0b1)
20	RWX	WOX_AND	WOX_OR	TP_GPIO_TRACE_START: Start trace to debug macros, Reset(0b0)
21	RWX	WOX_AND	WOX_OR	TP_GPIO_TRACE_STOP: Stop trace to debug macros, Reset(0b0)

Bits	PCB	PCB1	PCB2	Field Mnemonic: Description
22	RWX	WOX_AND	WOX_OR	TP_GPIO_TRACE_RESET: Reset trace to debug macros, Reset(0b0)
23	RWX	WOX_AND	WOX_OR	NOT_USED5: not used, Reset(0b0)
24:25	RWX	WOX_AND	WOX_OR	TC_GPIO_CLKDIV_SEL_DC: Select clock divider ratio, Reset(0b0)
26	RWX	WOX_AND	WOX_OR	NOT_USED6: not used, Reset(0b0)
27	RWX	WOX_AND	WOX_OR	NOT_USED7: not used, Reset(0b0)
28:31	RWX	WOX_AND	WOX_OR	NOT_USED8: not used, Reset(0b0)
32:39	RWX	WOX_AND	WOX_OR	TC_PSRO_SEL_DC: PSRO selects(0:7), Reset(0b0)
40:42	RWX	WOX_AND	WOX_OR	NOT_USED10: not used, Reset(0b0)
43:45	RWX	WOX_AND	WOX_OR	NOT_USED11: not used, Reset(0b0)
46	RWX	WOX_AND	WOX_OR	TC_PLLMEMIO_PADTEST_T_K: Wrap Sel for BSC, Reset(0b0)
47	RWX	WOX_AND	WOX_OR	TC_PLLMEMIO_PADTEST_C_K: Int Mode for BSC, Reset(0b0)
48	RWX	WOX_AND	WOX_OR	NOT_USED12: not used, Reset(0b0)
49	RWX	WOX_AND	WOX_OR	NOT_USED13: not used, Reset(0b0)
50	RWX	WOX_AND	WOX_OR	NOT_USED14: not used, Reset(0b0)
51	RWX	WOX_AND	WOX_OR	NOT_USED15: not used, Reset(0b0)
52	RWX	WOX_AND	WOX_OR	NOT_USED16: not used, Reset(0b0)
53	RWX	WOX_AND	WOX_OR	NOT_USED17: not used, Reset(0b0)
54	RWX	WOX_AND	WOX_OR	NOT_USED18: not used, Reset(0b0)
55	RWX	WOX_AND	WOX_OR	NOT_USED19: not used, Reset(0b0)
56	RWX	WOX_AND	WOX_OR	NOT_USED20: not used, Reset(0b0)
57	RWX	WOX_AND	WOX_OR	NOT_USED21: not used, Reset(0b0)
58	RWX	WOX_AND	WOX_OR	NOT_USED22: not used, Reset(0b0)
59	RWX	WOX_AND	WOX_OR	NOT_USED23: not used, Reset(0b0)
60	RWX	WOX_AND	WOX_OR	TC_MASK_CC_PCB_ERR_DC: mask for pcb error (access or parity) in CC, Reset(0b0)
61	RWX	WOX_AND	WOX_OR	TC_MASK_CC_SCAN_OPCG_ERR_DC: mask for pcb write while OPCG_IP / scan collision in CC, Reset(0b0)
62	RWX	WOX_AND	WOX_OR	TC_CC_LCC_EDGE_DELAYED_DC: Offset the clocking in the f domain by one cycle, Reset(0b1)
63	RWX	WOX_AND	WOX_OR	TC_FENCE_PERV_DC: Fence pervasive logic during scan (init value 1), Reset(0b1)

Register Name	*GP Register 1*
Mnemonic	TCM.GP1
Address	0000000003000001 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description

Register Name	***DDR Write Command Parameters***
Mnemonic	MBU.MBA01.MBA_SRQ.MBA_WRQ0Q
Address	000000000301040D (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:4	RW	MBA_WRQ0Q_CFG_WRITE_HW_MARK: Write highwater mark(force writes HPenables writes)
5	RW	MBA_WRQ0Q_CFG_WRQ_FIFO_MODE: Prevent reordering in the WRQ(only entry0 can be selected) HP Cleaner writes will not get selected till they are in entry 0.
6	RW	MBA_WRQ0Q_CFG_DISABLE_WR_PG_MODE: Disable page commands for WRQ
7:18	RW	MBA_WRQ0Q_CFG_WRQ_ENTRY0_HP_DLY: Time for entry0 of the WRQ before it forces HP setting this dial to a 0, will disable entry0 HP
19	RW	MBA_WRQ0Q_CFG_WRQ_FLUSH_WR_RANK: When one write is issued to a rank, try to force more writes to that rank to avoid multiple write to read same rank penalties.
20	RW	MBA_WRQ0Q_CFG_WRQ_ENABLE_NON_HP_WR: Allow writes when they do not meet a condition like entry0_flush, or rd_idle_allow_wr, etc
21:32	RW	MBA_WRQ0Q_CFG_ENTRY0_MIN_FOR_RRQ_IDLE_WR: This is an added condition to allowing writes when the RRQ is idle. This addition allows for multiple writes to stack up in the WRQ before starting the write burst.
33:37	RW	MBA_WRQ0Q_CFG_RRQ_IDLE_LOW_WATERMARK: RRQ idle will also allow writes if the above condition is met of the wrq meets the cfg_rrq_idle_low_watermark condition. For example if this dial is set to 8, and there are more then 8 entries in the wrq then the condition will allow writes when the rrq_idle period is met.
38:43	RW	MBA_WRQ0Q_CFG_WRQ_SKIP_LIMIT: The number of times entry0 of the WRQ can be skipped before entry0 prevents older writes from being issued until entry0 is sent.
44	RW	MBA_WRQ0Q_CFG_WRQ_CLN_HP_ENABLE: Set to 1 to enable cleaner_hp_flush event. When the cleaner is backed up, it will tell the MBA wrq to flush writes to a specific rank. Set to 0, this input into MBA is ignored.
45:52	RW	MBA_WRQ0Q_CFG_WRQ_HANG_THRESHOLD: Hang detection for entry0 of WRQ. Incrememnts every mcbist_srq_hang_pulse(2048 phase hold cycles), and will set a fir when the count=threshold and another pulse is received. Since this checks for count=threshold, a value of 0 is not valid.
53:60	RW	MBA_WRQ0Q_CFG_RRQ_HANG_THRESHOLD: Hang detection for entry0 of RRQ. Incrememnts every mcbist_srq_hang_pulse(2048 phase hold cycles), and will set a fir when the count=threshold and another pulse is received. Since this checks for count=threshold, a value of 0 is not valid.
61:63	RW	MBA_WRQ0Q_RESERVED_61_63: Reserved

Register Name	***Power Control Register 0***
Mnemonic	MBU.MBA01.MBA_SRQ.PC.MBARPC0Q
Address	0000000003010434 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBARPC0Q_CFG_LP2_ENTRY_REQ: Setreset by firmware. When set, MBA powers down all ranks and sets cfg_lp2_state=1. Set by firmware during LP2 entry procedure, after all traffic and refresh has been stopped. Cleared by firmware during LP2 exit procedure.
1	ROX	MBARPC0Q_CFG_LP2_STATE: Read only status bit; set by hardware when cfg_lp2_entry_req is active AND all ranks are powered down; reset by hardware when cfg_lp2_entry_req is reset
2	RW	MBARPC0Q_CFG_MIN_MAX_DOMAINS_ENABLE: This is an overall enable for power domain control. If power control is disabled, the CKEs will always be set to a '1'.

Bits	SCOM	Field Mnemonic: Description
3:5	RW	MBARPC0Q_CFG_MIN_MAX_DOMAINS: Maxall_minall means power control will not limit the number of domains accessible at a given time. Power domains will not be powered down even if they go idle, unless min_domain_reduction is enabled. Maxall_minx will permit idle power down to reduce the number of domains powered up once a domain has gone idle, but it won't restrict the maximum domains powered up. Max1_minx restricts the number of domains that can be powered up at a given time to 1. Values: MAXALL_MINALL=>0b000 MAXALL_MIN1=>0b001 MAXALL_MIN0=>0b010 MAX1_MIN1=>0b011 MAX1_MIN0=>0b100
6:10	RW	MBARPC0Q_CFG_PUP_AVAIL: Specifies how many DRAM command clocks for power control to wait from CKE going high to activate
11:15	RW	MBARPC0Q_CFG_PDN_PUP: Specifies how many DRAM command clocks for power control to wait from CKE going low to high again (enforces minimum time in power down)
16:20	RW	MBARPC0Q_CFG_PUP_PDN: Specifies how many DRAM command clocks for power control to wait from CKE going high to low again (enforces minimum time powered up)
21	RW	MBARPC0Q_RESERVED_21: Reserved
22	RW	MBARPC0Q_CFG_MIN_DOMAIN_REDUCTION_ENABLE: This allows a dynamic reduction of the minimum domains to 0 when no memory traffic has been seen over the specified cfg_min_domain_reduction_time; min domains will be restored once traffic is seen; the adjusted min domains won't be reflected in or over-write the cfg_min_max_domains setting (adjustment made internal to logic).
23:32	RW	MBARPC0Q_CFG_MIN_DOMAIN_REDUCTION_TIME: Specifies how many DRAM command clocks the MBA must be idle before min_cke is reduced to 0.
33	RW	MBARPC0Q_CFG_PUP_AFTER_ACTIVATE_WAIT_ENABLE: Once a configurable time has been met since the last activate, a subsequent domain can be powered up, even if the powering-down domain has not been powered down yet.
34:41	RW	MBARPC0Q_CFG_PUP_AFTER_ACTIVATE_WAIT_TIME: Specifies how many DRAM command clocks the MBA must be idle before minimum domains is reduced to 0.
42	RW	MBARPC0Q_CFG_FORCE_SPARE_PUP: Forces all spare CKEs to couple with their respective primary CKEs. This bit should not be toggled during runtime or when calibration is enabled.
43:63	RW	MBARPC0Q_RESERVED_43_63: Reserved

Register Name	***Refresh Avoidance Control Register***
Mnemonic	MBU.MBA01.MBA_SRQ.PC.MBAREFAQ
Address	0000000003010436 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBAREFAQ_CFG_REFRESH_LP_DYN_WAIT_ENABLE: When enabled, a low priority refresh wait function takes into account the power state of the rank, how long the rank has been idle and the rank's refresh backlog queue count when scheduling a low priority refresh. If disabled, a low priority refresh is scheduled once the read reorder queue has been idle for a programmable number of cycles.
1	RW	MBAREFAQ_CFG_REFRESH_HP_RANK_BIAS_ENABLE: When enabled, the refresh logic sends a signal to bias the prefetch and final arbitration logic ahead of issuing a high priority refresh.
2	RW	MBAREFAQ_CFG_REFRESH_HP_RANK_BLOCK_ENABLE: When enabled, the refresh logic sends a block signal when issuing a high priority refresh. The block signal prevents new demand requests to the refreshing rank from overwhelming the read reorder queue.
3	RW	MBAREFAQ_RESERVED_3: Reserved
4:7	RW	MBAREFAQ_CFG_REFRESH_PUP_THRESHOLD: If cfg_refresh_lp_dyn_wait_enable=1, then the logic waits until the refresh backlog queue reaches this threshold before powering up to service a low priority refresh. If power control is disabled (rank never powered down), this setting becomes irrelevant as the rank will always be powered up, and the refresh will still be gated until the appropriate idle time has been met. This setting should not be set greater than cfg_priority_threshold (the refresh high priority threshold).

Bits	SCOM	Field Mnemonic: Description
8:10	RW	MBAREFAQ_CFG_REFRESH_BLQ_EQ1_COEF: Values: 0=>0b000 0_125=>0b001 0_25=>0b010 0_5=>0b011 0_75=>0b100 1_0=>0b101 1_5=>0b110 2_0=>0b111

20:22	RW	MBAREFAQ_CFG_REFRESH_BLQ_EQ5_COEF: Values: 0=>0b000 0_125=>0b001 0_25=>0b010 0_5=>0b011 0_75=>0b100 1_0=>0b101 1_5=>0b110 2_0=>0b111
23:25	RW	MBAREFAQ_CFG_REFRESH_BLQ_EQ6_COEF: Values: 0=>0b000 0_125=>0b001 0_25=>0b010 0_5=>0b011 0_75=>0b100 1_0=>0b101 1_5=>0b110 2_0=>0b111

Bits	SCOM	Field Mnemonic: Description
26:31	RW	MBAREFAQ_CFG_RRQ_REF_HINT_DLY: Programmable timer that determines the delay from the refresh pending backlog = HP threshold to the assertion of a scheduling hint to the read reorder queue to accommodate the impending high priority refresh. (B) NOTE: This delay counts in multiples of 4 DDR clocks (per default hp ref sub counter setting)
32:37	RW	MBAREFAQ_CFG_ASSERT_REFRESH_BLOCK_DLY: Programmable timer that determines the delay from the refresh pending backlog = HP threshold to where subsequent commands from MBS to the refresh rank are blocked. This must be greater than cfg_rrq_ref_hint_dly. (C) NOTE: This delay counts in multiples of 4 DDR clocks (per default hp ref sub counter setting)
38:43	RW	MBAREFAQ_CFG_FORCE_HP_REF_REQ_DLY: Programmable timer that determines the delay from the refresh pending backlog = HP threshold to where the refresh must be serviced by the final command arbiter. This must be greater than cfg_assert_refresh_block_dly. (D) NOTE: This delay counts in multiples of 4 DDR clocks (per default hp ref sub counter setting)
44:49	RW	MBAREFAQ_CFG_REF_BLOCK_STOP_DLY: Programmable setting which is subtracted from the tRFC timer. The result is used to determine when the block signal can be deasserted leading up to the end of a tRFC period. This allows new commands targeting the refresh domain being refreshed to progress to the rrq so that they are ready to go as soon as tRFC ends. (N)
50:63	RW	MBAREFAQ_RESERVED_50_63: Reserved

Description	

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	MBA_PMU5Q_MED_IDLE_COUNT: Counts the number of times the med idle threshold was met (counts 2:1Dram addr frequency)
32:63	ROX	MBA_PMU5Q_HIGH_IDLE_COUNT: Counts the number of times the high idle threshold was met (counts 2:1Dram addr frequency)

Register Name	***Performance Monitor Counts***
Mnemonic	MBU.MBA01.MBA_SRQ.MBA_PMU6Q
Address	000000000301043D (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:17	RWX_WCLRPART	MBA_PMU6Q_TOTAL_GAP_COUNTS: Increments by 1 for any gap that is greater than or equal to the gap programmed by the gap length field (see bits 36-38 for info)
18:35	RWX_WCLRPART	MBA_PMU6Q_SPECIFIC_GAP_COUNT: Total number of gaps greater than or equal to gap length caused by reason specified in field 39:42.
36:38	RW	MBA_PMU6Q_GAP_LENGTH_ADDER: The gap length is this field +4. So a value of 0 will count gaps that occur every 4 cycles.
39:42	RW	MBA_PMU6Q_SPECIFIC_GAP_CONDITION: This field chooses the condition for the specific gap counter(18:35) refresh_busy => 0b0001; bank_busy => 0b0010; power_down_busy => 0b0011; high_priority_write => 0b0100; entry_0_HP => 0b0101; NM_busy => 0b0110; read_queue_empty => 0b0111; write_queue_empty => 0b1000; read_and_write_queue_empty => 0b1001; bg_busy => 0b1010; data_bus_busy => 0b1011; out_of_timers => 0b1100; Values: TFAW_BUSY=>0b0000 REFRESH_BUSY=>0b0001 BANK_BUSY=>0b0010 POWER_DOWN_BUSY=>0b0011 HIGH_PRIORITY_WRITE=>0b0100 ENTRY_0_HP=>0b0101 NM_BUSY=>0b0110 READ_QUEUE_EMPTY=>0b0111 WRITE_QUEUE_EMPTY=>0b1000 READ_AND_WRITE_QUEUE_EMPTY=>0b1001 BG_BUSY=>0b1010 DATA_BUS_BUSY=>0b1011 OUT_OF_TIMERS=>0b1100
43:60	RWX_WCLRPART	MBA_PMU6Q_CMD_TO_CMD_COUNT: Count the number of times the following command pattern occurs that is specified in bits 61:63.
61:63	RW	MBA_PMU6Q_COMMAND_PATTERN_TO_COUNT: Type of command pattern for counter in bits 43:60 should count. Values: RWSM_READ_TO_WRITE_SAME_MASTER=>0b000 RWDM_READ_TO_WRITE_DIFFERENT_MASTER=>0b001 RWXX_READ_TO_WRITE=>0b010 WRSM_WRITE_TO_READ_SAME_MASTER=>0b011 WRDM_WRITE_TO_READ_DIFFERENT_MASTER=>0b100 WRXX_WRITE_TO_READ=>0b101 RRDM_READ_TO_READ_DIFFERENT_MASTER=>0b110 WWDM_WRITE_TO_WRITE_DIFFERENT_MASTER=>0b111

Register Name	***MBA Error Injection***
Mnemonic	MBU.MBA01.MBA_WRD.MBA_INJQ
Address	0000000003010448 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RWX	MBA_INJQ_CFG_RDTAG_ERR_INJ: Self resetting bit. Writing a one will send a rdtag error inject pulse. After the pulse is sent it will be reset to 0
1	RWX	MBA_INJQ_CFG_RRQ_POP_ERR_INJ: Self resetting bit. Writing a one will send a rrq pop error inject pulse. After the pulse is sent it will be reset to 0
2	RW	MBA_INJQ_CFG_WR_ECC_INJ_MODE: Inject mode for write data ECC injection. Values: SINGLE_SHOT=>0b0 CONTINUOUS=>0b1
3	RW	MBA_INJQ_CFG_WR_ECC_ERR_INJ: Inject enable. The write inject type (CE, UE, etc..) and specific write data bit(s) corrupted are indicated by the MBA Error Control Register. For single shot mode, bit must be cleared and re-set to enable another error inject. For continuous mode, error injection will occur on valid operations until bit is cleared.

Bits	SCOM	Field Mnemonic: Description
4	RW	MBA_INJQ_CFG_WRD_BUFF_INJ_MODE: Inject mode for write re-order data buffer ECC Values: SINGLE_SHOT=>0b0 CONTINUOUS=>0b1
5	RW	MBA_INJQ_CFG_WRD_BUFFER_CE_INJ: Inject CE error into write reorder data buffer. For single shot mode, but must be cleared and reset to enable another error inject. For continuous mode, error injection will occur on valid operations until bit is cleared. Values: NO_CE_ECC_INJECT_INTO_WRITE_REORDER_DATA_BUFFER=>0b0 CE_ECC_INJECT_INTO_WRITE_REORDER_DATA_BUFFER_BASED_ON_INJ_MODE=>0b1
6	RW	MBA_INJQ_CFG_WRD_BUFFER_UE_INJ: Inject UE error into write reorder data buffer. For single shot mode, but must be cleared and reset to enable another error inject. For continuous mode, error injection will occur on valid operations until bit is cleared. Values: NO_UE_ECC_INJECT_INTO_WRITE_REORDER_DATA_BUFFER=>0b0 UE_ECC_INJECT_INTO_WRITE_REORDER_DATA_BUFFER_BASED_ON_INJ_MODE=>0b1

Register Name	***FBIST Memory Parameter Register 0***
Mnemonic	FBIST.FBM.FBMPARM0
Address	0000000003010493 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	FBMPARM0_CFG_FBM_MODE: Sets the FBIST mode Values: DDR_MODE=>0b0 CACHE_MODE=>0b1
1	RW	FBMPARM0_CFG_FBM_SYS_TYPE: Values: PSERIES=>0b0 (POWER8) Reserved=>0b1
2	RW	FBMPARM0_CFG_FBM_MBA_CHK: Configures which MBA will be checked Values: CHECK_MBA01=>0b0 CHECK_MBA23=>0b1

Bits	SCOM	Field Mnemonic: Description
3	RW	FBMPARM0_CFG_FBM_US_MUX_SEL: Mux select for the upstream data path either fbist or ddr traffic. Default is 0. For normal chip mode. Values: DDR_TRAFFIC=>0b0 FBIST_TRAFFIC=>0b1
4	RW	FBMPARM0_CFG_FBM_DDR_MODE_OVRD: When on, this will shut off the fbist memory side logic. Allowing DDR mode to be used with DRAMs. This is not supported and should be used as a debug consideration only.
5:7	RW	FBMPARM0_RESERVED_5_7: Reserved Values: RESERVED_5_7=>0b000
8	RW	FBMPARM0_CFG_FBM_ADDR_CHK: Turn on or off address checking
9	RW	FBMPARM0_RESERVED_9: Reserved
10	RW	FBMPARM0_CFG_FBM_DP_TAG_LOC: The dptag includes an invert bit, the data pattern and wr tag bits. The 12 dp pattern bits will be placed in the 12b starting at bit 32 of the DWs selected. Be sure that the RMW command avoids writing to these bit positions. RMW is allowed to overwrite these bit positions ONLY for an entire cache line merge. Values: TAG_IN_DW048C=>0b0 TAG_IN_DW159D=>0b1
11	RW	FBMPARM0_CFG_FBM_DDR4: Choose ddr3 or ddr4 mem type Values: DDR3=>0b0 DDR4=>0b1
12	RW	FBMPARM0_CFG_FBM_DS_CRC: Turn on or off Downstream CRC generation
13	RW	FBMPARM0_CFG_FBM_US_CRC: Turn on or off upstream crc checking
14:15	RW	FBMPARM0_RESERVED_14_15: Reserved Reserved
16	RW	FBMPARM0_CFG_FBM_RST_KEEPER: FBM Reset keeper Values: DOES_NOTHING=>0b0 RESET_KEEPER=>0b1
17	RW	FBMPARM0_CFG_FBM_CACHELINE_CHK: Choose a specific command tag to read a full cache line into the expected data register, or use the next full upstream cache line Values: USER_SPECIFIED=>0b0 NEXT=>0b1
18	RW	FBMPARM0_CFG_FBM_2N_ADDR: Turn on or off 2N addr mode
19	RW	FBMPARM0_CFG_FBN_MBSXCRQ5: Should be set to same value as register bit mbsxcrq(5)
20:63	RO	constant=0b00000000000000000000000000000000000000000000

Register Name	***FBIST Memory Read Data Delay Register***
Mnemonic	FBIST.FBM.FBMRDDR
Address	0000000003010494 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:7	RW	FBMRDDR_CFG_FBM_DATA_RD_DLY: Amount of delay in memory clock 2 cycles before the pseudo read data is made available to MBS.
8:63	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Register Name	*FBIST Memory Data Config Register*
Mnemonic	FBIST.FBM.FBMDCR
Address	0000000003010497 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	FBMDCR_CFG_FBM_DATA_INV: Data inversion configuration is used in conjunction with the data pattern inversion bits in the fbmmr0:7 registers. Each bit from 0 through 16 determines which dw of data will be inverted. In example, if b0 is 1 then dw0 will be inverted should the data pattern inversion bit for the commands (in fbmmr0:7) is also set. This allows the used to create data traffic on certain buses that will flip every cycle, etc.
16:63	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Register Name	*FBIST Memory Command Reporting Config Register*
Mnemonic	FBIST.FBM.FBMCRCR
Address	0000000003010499 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:7	RW	FBMCRCR_CFG_FBM_CMD_CHK_TAG: Bits 0:7 The user specified command checking tag, used to select a tag to read out the full cache line (bit0 is ignored). Used with fbmparm0(17)
8:63	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Register Name	*FBIST Memory RMW Cmd Register*
Mnemonic	FBIST.FBM.FBMRMWC
Address	000000003301049A (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:3	RW	FBMRMWC_CFG_FBM_RMW_FUNC: Default is for RMW partial write. No ALU support at this time
4	RW	FBMRMWC_RESERVED_4: 1.Reserved
5:11	RW	FBMRMWC_CFG_FBM_RMW_TSZ: Default set for 1 Byte Partial write
12	RW	FBMRMWC_RESERVED_12: Reserved
13:19	RW	FBMRMWC_CFG_FBM_RMW_ADDR: Sets the byte address in the cache line for the partial write (be sure not to use the location of the wrtag and data pattern tag) Special considerations should be taken when running a test with random data as the first byte of each DW is used to reconstruct the data for checking.
20:63	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Address	000000000301060F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBASCTLQ_STOP_ETE_NOW: Stop on ete immediate, attention set when ete occurs When set, a scrubread op will immediately stop when an Error Threshold Equal (ETE) condition is detected.
1	RW	MBASCTLQ_STOP_ETE_RANK_END: Stop on ete end of rank When set, a scrubread op will stop at the end of the current rank, when an Error Threshold Equal condition is detected. Attention is set at the end of the rank.
2	RW	MBASCTLQ_STOP_NCE_HARD: Stop on Hard NCE ETE When set, a scrubread op will stop (immediate or end of rank) when a Hard NCE threshold equal error is detected. Stop immediately or at end of rank is determined with bits 0 and 1.

Bits	SCOM	Field Mnemonic: Description
3	RW	MBASCTLQ_STOP_NCE_INTERMITTENT: Stop on Intermittent NCE ETE When set, a scrubread op will stop (immediate or end of rank) when an Intermittent NCE threshold equal error is detected.. Stop immediately or at end of rank is determined with bits 0 and 1.
4	RW	MBASCTLQ_STOP_NCE_SOFT: Stop on Soft NCE ETE When set, a scrubread op will stop (immediate or end of rank) when a Soft NCE threshold equal error is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
5	RW	MBASCTLQ_STOP_SCE: Stop on SCE When set, a scrubread op will stop (immediate or end of rank) when a SCE is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
6	RW	MBASCTLQ_STOP_MCE: Stop on MCE When set, a scrubread op will stop (immediate or end of rank) when a MCE is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
7	RW	MBASCTLQ_STOP_RETRYCE: Stop on Retry CE ETE When set, a scrubread op will stop (immediate or end of rank) when a Retry CE threshold equal error is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
8	RW	MBASCTLQ_STOP_MPE: Stop on MPE When set, a scrubread op will stop (immediate or end of rank) when a Mark Place Error is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
9	RW	MBASCTLQ_STOP_UE: Stop on UE When set, a scrubread op will stop (immediate or end of rank) when a SD UE is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
10	RW	MBASCTLQ_STOP_ON_END_ADDRESS: Stop on End Address When set, any multi-address maintenance operation will stop when the MBMACA value equals the MBMEA (end address) value. When unset, it will continue to increment pass the end address.
11	RW	MBASCTLQ_ENABLE_ATT_MAINT_CMD_DONE: When set, the Maintenance Complete Attention is set when a maintenance operation stops (immediate or end of rank)
12	RW	MBASCTLQ_STOP_SUE: Stop on SUE When set, a scrubread op will stop (immediate or end of rank) when a SUE is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
13:14	RW	MBASCTLQ_CMD_TIMEOUT_SEL: Command Timeout Select - selects the time interval for a maint command to be sent out before it times out Values: 262144_CYCLES=>0b00 1048576_CYCLES=>0b01 2097152_CYCLES=>0b10 4194304_CYCLES=>0b11
15	RW	MBASCTLQ_RESET_KEEPER: Reset Keeper Writing this bit to 1 will pulse the reset of the hold latched in the MBA c_err_rpt's
16	RW	MBASCTLQ_MBSPA_BIT_0_MODE: MBSPA Bit 0 mode When unset, MBSPA(0) is set ONLY when a maintenance command completes successfully without hitting a stop-on-error condition. When set, MBSPA(0) is set when a maintenance command stops (whether from a command complete or stop-on-error condition).
17:63	RW	MBASCTLQ_RESERVED_17_63: Reserved

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_30_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_30_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_30_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_30_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_30_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_30_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_30_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_30_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 31*
Mnemonic	MBU.MBA01.MBA_MCBIST.CCS.CCS_INST_ARR1_31

Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RWX	CCS_CNTLQ_CCS_START: Start bit - Self resetting bit. Kicks off the CCS operation
1	RWX	CCS_CNTLQ_CCS_STOP: Stop bit - Self resetting bit. Stops Current CCS operation
2:63	RO	constant=0b00000000000000000000000000000000000000000000000000000000000000

Register Name	*Configured Command Sequence Status Register*
Mnemonic	MBU.MBA01.MBA_MCBIST.SCOMFIR.CCS_STATQ
Address	00000000030106A6 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RWX	CCS_STATQ_CCS_IP: IP bit - Hdw sets to a '1'b when CCS run in progress
1	RWX	CCS_STATQ_CCS_DONE: Done bit - Hdw sets to a '1'b when CCS run complete
2	RWX	CCS_STATQ_CCS_FAIL: Fail bit - Hdw sets to a '1'b when CCS run failed
3:5	RWX	CCS_STATQ_CCS_FAIL_TYPE: Fail Type - Indicates type of CCS failure: Bit 3-> Read Miscompare Bit 4 -> UE or SUE Error Bit 5 -> Calibration operation times out

Bits	SCOM	Field Mnemonic: Description
6:63	RO	constant=0b00000000000000000000000000000000000000000000000000000000000000

Register Name	*Configured Command Sequence Mode Register*
Mnemonic	MBU.MBA01.MBA_MCBIST.SCOMFIR.CCS_MODEQ
Address	00000000030106A7 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	CCS_MODEQ_CCS_STOP_ON_ERR: User sets to a '1'b to tell the Hdw to stop CCS whenever failure occurs. When a '0'b, Hdw will continue CCS even if a failure occurs.
1	RW	CCS_MODEQ_CCS_UE_DISABLE: User sets to a '1'b to force the Hdw to ignore any array ue or sue errors during CCS command fetching.
2:3	RW	CCS_MODEQ_CCS_DATA_SEL: User sets to indicate which group of the data burst to compare. Values: DDR_BURST_1_AND_2=>0b00 DDR_BURST_3_AND_4=>0b01 DDR_BURST_5_AND_6=>0b10 DDR_BURST_7_AND_8=>0b11
4:5	RW	CCS_MODEQ_MCBIST_DDR_DPHY_NCLK: DDR Phy nclk control Values: PHY_NCLK_OUTPUT_DISABLED=>0b00 PHY_NCLK_OUTPUT_ENABLED=>0b01
6:7	RW	CCS_MODEQ_MCBIST_DDR_DPHY_PCLK: DDR Phy pclk control Values: PHY_PCLK_OUTPUT_DISABLED=>0b00 PHY_PCLK_OUTPUT_ENABLED=>0b10
8:23	RW	CCS_MODEQ_DDR_CAL_TIMEOUT_CNT: DDR calibration time counter - amount of time to wait for DDR calibration to complete. This value is multiplied by the factor in bits 30:31 to get the total timeout wait time.
24	RW	CCS_MODEQ_MCBIST_DDR_RESETN: DDR Resetn Signal
25	RW	CCS_MODEQ_MCBIST_DDR_DFI_RESET_RECOVER: DDR Reset Recover Signal
26	RW	CCS_MODEQ_COPY_CKE_TO_SPARE_CKE: Copy CKE signals to CKE Spare on both ports 0 - Spare CKEs not copied with values from CKE(0:1) and CKE(4:5) 1 - Port A CKE(0:1) copied to Port A CKE(2:3), Port A CKE(4:5) copied to Port A CKE(6:7), Port B CKE(0:1) copied to Port B CKE(2:3) and Port B CKE(4:5) copied to Port B CKE(6:7)
27	RW	CCS_MODEQ_DISABLE_ECC_ARRAY_CHK: Disable ecc checking on the CCS arrays 0 - ECC checking on 1 - ECC checking off
28	RW	CCS_MODEQ_DISABLE_ECC_ARRAY_CORRECTION: Disable ecc correction on the CCS arrays 0 - ECC correction on 1 - ECC correction off
29	RW	CCS_MODEQ_CCS_ADDR_MUX_SEL: CCS Address Mux Sel - This bit should be turned on until all multiple CCS instructions are completed. 0 - selects address data from mainline logic 1 - selects address data from CCS logic
30:31	RW	CCS_MODEQ_DDR_CAL_TIMEOUT_CNT_MULT: DDR calibration time counter multiplication factor. This value is multiplied by the counter in bits 8:23 to get the total timeout wait time. Values: 1_CCS_CYCLE=>0b00 512_CCS_CYCLES=>0b01 32768_CCS_CYCLES=>0b10 1073741824_CCS_CYCLES=>0b11
32:47	RW	CCS_MODEQ_MA_B_ADDRESS_IDLE_PAT: DDR Row and Column Address Idle Pattern (Addr 0 - Addr 15) For DDR4: Addr 14 - 15 is Addr 17 & BG1

Bits	SCOM	Field Mnemonic: Description
48:50	RW	CCS_MODEQ_MA_B_BANK_IDLE_PAT: DDR Bank Address Idle Pattern For DDR3: Bank 0 - Bank 2 For DDR4: B0, B1, BG0
51	RW	CCS_MODEQ_MA_B_ACTIVATE_IDLE_PAT: DDR4 Activate Idle Pattern
52	RW	CCS_MODEQ_MA_B_RASN_IDLE_PAT: DDR RAS# Idle Pattern
53	RW	CCS_MODEQ_MA_B_CASN_IDLE_PAT: DDR CAS# Idle Pattern
54	RW	CCS_MODEQ_MA_B_WEN_IDLE_PAT: DDR Write Enable (WE#) Idle Pattern
55	RW	CCS_MODEQ_NTTM_MODE: Non Traditional Transparent Mode When set to 1, limited non-traditional read and write operations can be done.
56:59	RW	CCS_MODEQ_NTTM_RW_DATA_DLY: Non Traditional Transparent ReadWrite Delay Use to delay the Write data start pulse or Read Data capture pulse to the DDR Phys. Maximum delay of 15 cycles is possible.
60	RW	CCS_MODEQ_DDR_RESETN_ENABLE: DDR Resetn Enabled When set to 1, bit 16 of the CCS_INST_ARR0 will be driven out to DDR Resetn. When set to 0, ccs_modeq(24) will be driven out to DDR Resetn.
61	RW	CCS_MODEQ_DDR_PARITY_ENABLE: DDR Parity Enabled When set to 1, bit 60 of the CCS_INST_ARR0 will be driven out to DDR parity. When set to 0, the hardware calculates the parity.
62	RW	CCS_MODEQ_GP_BIT_3_ENABLE: GP bit 3 enable (force_mclk_low) When set to 1, the inverted value of GP(3) will be driven on the force_mclk_low signal to the DDR PHYs. When set to 0, the value of inverted value of ccs_modeq(63) will be driven on the force_mclk_low signal to the DDR PHYs
63	RW	CCS_MODEQ_FORCE_MCLK_LOW_N: force_mclk_low_n When set to 0, a '1' will be driven on the force_mclk_low signal to the DDR PHYs. When set to 1, the inverted value of ccs_modeq(63) will be driven on the force_mclk_low signal to the DDR PHYs

Register Name	***MCBIST Memory Parameter Register***
Mnemonic	MBU.MBA01.MBA_MCBIST.SCOMFIR.MCBPARMQ
Address	00000000030106AF (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:49	RW	MCBPARMQ_RESERVED_0_49: Not used
50:52	RW	MCBPARMQ_CFG_RANDCMD_WGT: Specifies the weighting of random commands as follows (%Read %Write): Values: 12_87=>0b000 25_75=>0b001 50_50=>0b010 75_25=>0b011 87_12=>0b100
53:59	RW	MCBPARMQ_CFG_MIN_CMD_GAP: This is the minimum number of cycles between commands when cfg_en_randcmd_gap is a 0. If cfg_en_randcmd_gap is a 1 this becomes a 7 bit seed for the LFSR that randomly generates the gap intervals between 1-127. A value of all zeros will force MCBIST to issues commands as fast as possible.
60	RW	MCBPARMQ_CFG_EN_RANDCMD_GAP: When set to a 1 random command gaps from 1-1023 cycles are enabled and cfg_min_cmd_gap is disabled and becomes a seed for a LFSR that is randomly generating 1-127 cycle gaps (there is another 8 bit LFSR that is generating a 1-8 cycle multiplier).
61:62	RW	MCBPARMQ_CFG_RANDGAP_WGT: Forces the following command gap intervals when cfg_en_randcmd_gap is a 1: 00: 1 to 1023 cycles. 01: 1 to 511 cycles. 10: 1 to 255 cycles. 11: 1 to 127 cycles.
63	RW	MCBPARMQ_CFG_BC4_EN: BC4 enable When set, it enables BC4 data mode. This configuration cannot be use in ECC data mode.

Register Name	***MCBIST Runtime Counter Register***
Mnemonic	MBU.MBA01.MBA_MCBIST.SCOMFIR.RUNTIMECTRQ
Address	00000000030106B0 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:36	RWX	RUNTIMECTRQ_CFG_RUNTIME_CTR: This is the runtime counter facility. This 37 bit counter will increment every 4 memory clock cycles which gives it a maximum value of 687 seconds at 800 MHz or 824 seconds at 667 MHz.
37:63	RO	constant=0b00000000000000000000000000000

Register Name	***MCBIST Refresh Control Register***
Mnemonic	MBU.MBA01.MBA_MCBIST.SCOMFIR.MCBRCRQ
Address	00000000030106B1 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:31	RW	MCBRCRQ_RESERVED_0_31: Not used
32	RW	MCBRCRQ_CFG_RUNTIME_MCBALL: Configures what the runtime counter counts: Values: JUST_ONE_SUBTEST=>0b0 FULL_MCBIST_RUN=>0b1
33:37	RW	MCBRCRQ_CFG_RUNTIME_SUBTEST: If bit 32 is a 0, these bits represent the subtest number that should be counted.

Bits	SCOM	Field Mnemonic: Description
38	RW	MCBRCRQ_CFG_RUNTIME_OVERHEAD: If bit 32 is a 1, this bit configures the starting point of the runtime counter: Values: WITHOUT_OVERHEAD_WAIT_UNTIL_SUBTEST_0_IS_STARTED=>0b0 WITH_OVERHEAD_AS_SOON_AS_MCBIST_LEAVES_THE_IDLE_STATE=>0b1
39	RW	MCBRCRQ_RESERVED_39: Not used
40:63	RO	constant=0b00000000000000000000000

Register Name	*Port A Address Generator Configuration Register*
Mnemonic	MBU.MBA01.MBA_MCBIST.SCOMFIR.MCBAGRAQ
Address	00000000030106D6 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:5	RW	MCBAGRAQ_CFG_FIXED_WIDTH_A0: Sets the number of fixed slots in the address generator for Port A, socket A0. This will cause the bits from (MSB to MSB+cfg_fixed_width_a0-1) to not be included in the address generation. Used in conjunction with the configurable address map registers. Example: Fixed Rank, Fixed Bank, Fixed Row = 3 + 3 + 16 = 22 Program 0x16 Defaulted to a fixed Rank setting - Don needs to check this
6:11	RW	MCBAGRAQ_CFG_FIXED_WIDTH_A1: Sets the number of fixed slots in the address generator for Port A, socket A1. This will cause the bits from (MSB to MSB+cfg_fixed_width_a1-1) to not be included in the address generation. Used in conjunction with the configurable address map registers. Example: Fixed Rank, Fixed Bank, Fixed Row = 3 + 3 + 16 = 22 Program 0x16 Defaulted to a fixed Rank setting - Don needs to check this
12:15	RW	MCBAGRAQ_CFG_PORTA0_RATIO: Programs how often Port A, socket A0 addresses need to be generated relative to Port A, socket A1 addresses. Ratios can be set anywhere from [1-15] : [1-15]. Used for Deterministic address weighting.
16:19	RW	MCBAGRAQ_CFG_PORTA1_RATIO: Programs how often Port A, socket A1 addresses need to be generated relative to Port A, socket A0 addresses. Ratios can be set anywhere from [1-15] : [1-15]. Used for Deterministic address weighting.
20:22	RW	MCBAGRAQ_CFG_RANDPORT_WGT_A: Specify the weighting of A0A1 port accesses. A B 000 - 12.5 87.5 001 - 25 75 010 - 50 50 011 - 75 25 100 - 87.5 12.5
23	RW	MCBAGRAQ_CFG_DET_RAND_WGT_A: 0 - Use deterministic ratio to switch between socket A0 and socket A1 1 - Use random weighted ratio to switch between socket A0 and socket A1
24:25	RW	MCBAGRAQ_CFG_PORTA_SCKT_PPLTD: Socket Populated Values: SOCKET_A0_AND_SOCKET_A1_ARE_NOT_POPULATED=>0b00 ONLY_SOCKET_A1_IS_POPULATED=>0b01 ONLY_SOCKET_A0_IS_POPULATED=>0b10 SOCKET_A0_AND_SOCKET_A1_ARE_BOTH_POPULATED=>0b11
26:31	RW	MCBAGRAQ_RESERVED_26_31: Not used

Register Name	***DDR Write Command Parameters***
Mnemonic	MBU.MBA23.MBA_SRQ.MBA_WRQ0Q
Address	0000000003010C0D (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:4	RW	MBA_WRQ0Q_CFG_WRITE_HW_MARK: Write highwater mark(force writes HPenables writes)
5	RW	MBA_WRQ0Q_CFG_WRQ_FIFO_MODE: Prevent reordering in the WRQ(only entry0 can be selected) HP Cleaner writes will not get selected till they are in entry 0.
6	RW	MBA_WRQ0Q_CFG_DISABLE_WR_PG_MODE: Disable page commands for WRQ
7:18	RW	MBA_WRQ0Q_CFG_WRQ_ENTRY0_HP_DLY: Time for entry0 of the WRQ before it forces HP setting this dial to a 0, will disable entry0 HP
19	RW	MBA_WRQ0Q_CFG_WRQ_FLUSH_WR_RANK: When one write is issued to a rank, try to force more writes to that rank to avoid multiple write to read same rank penalties.
20	RW	MBA_WRQ0Q_CFG_WRQ_ENABLE_NON_HP_WR: Allow writes when they do not meet a condition like entry0_flush, or rd_idle_allow_wr, etc
21:32	RW	MBA_WRQ0Q_CFG_ENTRY0_MIN_FOR_RRQ_IDLE_WR: This is an added condition to allowing writes when the RRQ is idle. This addition allows for multiple writes to stack up in the WRQ before starting the write burst.
33:37	RW	MBA_WRQ0Q_CFG_RRQ_IDLE_LOW_WATERMARK: RRQ idle will also allow writes if the above condition is met of the wrq meets the cfg_rrq_idle_low_watermark condition. For example if this dial is set to 8, and there are more then 8 entries in the wrq then the condition will allow writes when the rrq_idle period is met.
38:43	RW	MBA_WRQ0Q_CFG_WRQ_SKIP_LIMIT: The number of times entry0 of the WRQ can be skipped before entry0 prevents older writes from being issued until entry0 is sent.
44	RW	MBA_WRQ0Q_CFG_WRQ_CLN_HP_ENABLE: Set to 1 to enable cleaner_hp_flush event. When the cleaner is backed up, it will tell the MBA wrq to flush writes to a specific rank. Set to 0, this input into MBA is ignored.
45:52	RW	MBA_WRQ0Q_CFG_WRQ_HANG_THRESHOLD: Hang detection for entry0 of WRQ. Incrememnts every mcbist_srq_hang_pulse(2048 phase hold cycles), and will set a fir when the count=threshold and another pulse is received. Since this checks for count=threshold, a value of 0 is not valid.
53:60	RW	MBA_WRQ0Q_CFG_RRQ_HANG_THRESHOLD: Hang detection for entry0 of RRQ. Incrememnts every mcbist_srq_hang_pulse(2048 phase hold cycles), and will set a fir when the count=threshold and another pulse is received. Since this checks for count=threshold, a value of 0 is not valid.

Register Name	***Power Control Register 0***
Mnemonic	MBU.MBA23.MBA_SRQ.PC.MBARPC0Q
Address	0000000003010C34 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBARPC0Q_CFG_LP2_ENTRY_REQ: Setreset by firmware. When set, MBA powers down all ranks and sets cfg_lp2_state=1. Set by firmware during LP2 entry procedure, after all traffic and refresh has been stopped. Cleared by firmware during LP2 exit procedure.
1	ROX	MBARPC0Q_CFG_LP2_STATE: Read only status bit; set by hardware when cfg_lp2_entry_req is active AND all ranks are powered down; reset by hardware when cfg_lp2_entry_req is reset
2	RW	MBARPC0Q_CFG_MIN_MAX_DOMAINS_ENABLE: This is an overall enable for power domain control. If power control is disabled, the CKEs will always be set to a '1'.
3:5	RW	MBARPC0Q_CFG_MIN_MAX_DOMAINS: Maxall_minall means power control will not limit the number of domains accessible at a given time. Power domains will not be powered down even if they go idle, unless min_domain_reduction is enabled. Maxall_minx will permit idle power down to reduce the number of domains powered up once a domain has gone idle, but it won't restrict the maximum domains powered up. Max1_minx restricts the number of domains that can be powered up at a given time to 1. Values: MAXALL_MINALL=>0b000 MAXALL_MIN1=>0b001 MAXALL_MIN0=>0b010 MAX1_MIN1=>0b011 MAX1_MIN0=>0b100
6:10	RW	MBARPC0Q_CFG_PUP_AVAIL: Specifies how many DRAM command clocks for power control to wait from CKE going high to activate
11:15	RW	MBARPC0Q_CFG_PDN_PUP: Specifies how many DRAM command clocks for power control to wait from CKE going low to high again (enforces minimum time in power down)
16:20	RW	MBARPC0Q_CFG_PUP_PDN: Specifies how many DRAM command clocks for power control to wait from CKE going high to low again (enforces minimum time powered up)
21	RW	MBARPC0Q_RESERVED_21: Reserved
22	RW	MBARPC0Q_CFG_MIN_DOMAIN_REDUCTION_ENABLE: This allows a dynamic reduction of the minimum domains to 0 when no memory traffic has been seen over the specified cfg_min_domain_reduction_time; min domains will be restored once traffic is seen; the adjusted min domains won't be reflected in or over-write the cfg_min_max_domains setting (adjustment made internal to logic).
23:32	RW	MBARPC0Q_CFG_MIN_DOMAIN_REDUCTION_TIME: Specifies how many DRAM command clocks the MBA must be idle before min_cke is reduced to 0.
33	RW	MBARPC0Q_CFG_PUP_AFTER_ACTIVATE_WAIT_ENABLE: Once a configurable time has been met since the last activate, a subsequent domain can be powered up, even if the powering-down domain has not been powered down yet.
34:41	RW	MBARPC0Q_CFG_PUP_AFTER_ACTIVATE_WAIT_TIME: Specifies how many DRAM command clocks the MBA must be idle before minimum domains is reduced to 0.
42	RW	MBARPC0Q_CFG_FORCE_SPARE_PUP: Forces all spare CKEs to couple with their respective primary CKEs. This bit should not be toggled during runtime or when calibration is enabled.
43:63	RW	MBARPC0Q_RESERVED_43_63: Reserved

Register Name	***Refresh Avoidance Control Register***
Mnemonic	MBU.MBA23.MBA_SRQ.PC.MBAREFAQ
Address	0000000003010C36 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBAREFAQ_CFG_REFRESH_LP_DYN_WAIT_ENABLE: When enabled, a low priority refresh wait function takes into account the power state of the rank, how long the rank has been idle and the rank's refresh backlog queue count when scheduling a low priority refresh. If disabled, a low priority refresh is scheduled once the read reorder queue has been idle for a programmable number of cycles.
1	RW	MBAREFAQ_CFG_REFRESH_HP_RANK_BIAS_ENABLE: When enabled, the refresh logic sends a signal to bias the prefetch and final arbitration logic ahead of issuing a high priority refresh.
2	RW	MBAREFAQ_CFG_REFRESH_HP_RANK_BLOCK_ENABLE: When enabled, the refresh logic sends a block signal when issuing a high priority refresh. The block signal prevents new demand requests to the refreshing rank from overwhelming the read reorder queue.
3	RW	MBAREFAQ_RESERVED_3: Reserved

Bits	SCOM	Field Mnemonic: Description
4:7	RW	MBAREFAQ_CFG_REFRESH_PUP_THRESHOLD: If cfg_refresh_lp_dyn_wait_enable=1, then the logic waits until the refresh backlog queue reaches this threshold before powering up to service a low priority refresh. If power control is disabled (rank never powered down), this setting becomes irrelevant as the rank will always be powered up, and the refresh will still be gated until the appropriate idle time has been met. This setting should not be set greater than cfg_priority_threshold (the refresh high priority threshold).
8:10	RW	MBAREFAQ_CFG_REFRESH_BLQ_EQ1_COEF: Values: 0=>0b000 0_125=>0b001 0_25=>0b010 0_5=>0b011 0_75=>0b100 1_0=>0b101 1_5=>0b110 2_0=>0b111

14:16	RW	MBAREFAQ_CFG_REFRESH_BLQ_EQ3_COEF: Values: 0=>0b000 0_125=>0b001 0_25=>0b010 0_5=>0b011 0_75=>0b100 1_0=>0b101 1_5=>0b110 2_0=>0b111
17:19	RW	MBAREFAQ_CFG_REFRESH_BLQ_EQ4_COEF: Values: 0=>0b000 0_125=>0b001 0_25=>0b010 0_5=>0b011 0_75=>0b100 1_0=>0b101 1_5=>0b110 2_0=>0b111
20:22	RW	MBAREFAQ_CFG_REFRESH_BLQ_EQ5_COEF: Values: 0=>0b000 0_125=>0b001 0_25=>0b010 0_5=>0b011 0_75=>0b100 1_0=>0b101 1_5=>0b110 2_0=>0b111

Bits	SCOM	Field Mnemonic: Description
23:25	RW	MBAREFAQ_CFG_REFRESH_BLQ_EQ6_COEF: Values: 0=>0b000 0_125=>0b001 0_25=>0b010 0_5=>0b011 0_75=>0b100 1_0=>0b101 1_5=>0b110 2_0=>0b111
26:31	RW	MBAREFAQ_CFG_RRQ_REF_HINT_DLY: Programmable timer that determines the delay from the refresh pending backlog = HP threshold to the assertion of a scheduling hint to the read reorder queue to accommodate the impending high priority refresh. (B) NOTE: This delay counts in multiples of 4 DDR clocks (per default hp ref sub counter setting)
32:37	RW	MBAREFAQ_CFG_ASSERT_REFRESH_BLOCK_DLY: Programmable timer that determines the delay from the refresh pending backlog = HP threshold to where subsequent commands from MBS to the refresh rank are blocked. This must be greater than cfg_rrq_ref_hint_dly. (C) NOTE: This delay counts in multiples of 4 DDR clocks (per default hp ref sub counter setting)
38:43	RW	MBAREFAQ_CFG_FORCE_HP_REF_REQ_DLY: Programmable timer that determines the delay from the refresh pending backlog = HP threshold to where the refresh must be serviced by the final command arbiter. This must be greater than cfg_assert_refresh_block_dly. (D) NOTE: This delay counts in multiples of 4 DDR clocks (per default hp ref sub counter setting)
44:49	RW	MBAREFAQ_CFG_REF_BLOCK_STOP_DLY: Programmable setting which is subtracted from the tRFC timer. The result is used to determine when the block signal can be deasserted leading up to the end of a tRFC period. This allows new commands targeting the refresh domain being refreshed to progress to the rrq so that they are ready to go as soon as tRFC ends. (N)
50:63	RW	MBAREFAQ_RESERVED_50_63: Reserved

Description	

Bits	SCOM	Field Mnemonic: Description
0:31	ROX	MBA_PMU5Q_MED_IDLE_COUNT: Counts the number of times the med idle threshold was met (counts 2:1Dram addr frequency)
32:63	ROX	MBA_PMU5Q_HIGH_IDLE_COUNT: Counts the number of times the high idle threshold was met (counts 2:1Dram addr frequency)

Register Name	***Performance Monitor Counts***
Mnemonic	MBU.MBA23.MBA_SRQ.MBA_PMU6Q
Address	0000000003010C3D (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:17	RWX_WCLRPART	MBA_PMU6Q_TOTAL_GAP_COUNTS: Increments by 1 for any gap that is greater than or equal to the gap programmed by the gap length field (see bits 36-38 for info)
18:35	RWX_WCLRPART	MBA_PMU6Q_SPECIFIC_GAP_COUNT: Total number of gaps greater than or equal to gap length caused by reason specified in field 39:42.
36:38	RW	MBA_PMU6Q_GAP_LENGTH_ADDER: The gap length is this field +4. So a value of 0 will count gaps that occur every 4 cycles.
39:42	RW	MBA_PMU6Q_SPECIFIC_GAP_CONDITION: This field chooses the condition for the specific gap counter(18:35) refresh_busy => 0b0001; bank_busy => 0b0010; power_down_busy => 0b0011; high_priority_write => 0b0100; entry_0_HP => 0b0101; NM_busy => 0b0110; read_queue_empty => 0b0111; write_queue_empty => 0b1000; read_and_write_queue_empty => 0b1001; bg_busy => 0b1010; data_bus_busy => 0b1011; out_of_timers => 0b1100; Values: TFAW_BUSY=>0b0000 REFRESH_BUSY=>0b0001 BANK_BUSY=>0b0010 POWER_DOWN_BUSY=>0b0011 HIGH_PRIORITY_WRITE=>0b0100 ENTRY_0_HP=>0b0101 NM_BUSY=>0b0110 READ_QUEUE_EMPTY=>0b0111 WRITE_QUEUE_EMPTY=>0b1000 READ_AND_WRITE_QUEUE_EMPTY=>0b1001 BG_BUSY=>0b1010 DATA_BUS_BUSY=>0b1011 OUT_OF_TIMERS=>0b1100
43:60	RWX_WCLRPART	MBA_PMU6Q_CMD_TO_CMD_COUNT: Count the number of times the following command pattern occurs that is specified in bits 61:63.

Bits	SCOM	Field Mnemonic: Description
61:63	RW	MBA_PMU6Q_COMMAND_PATTERN_TO_COUNT: Type of command pattern for counter in bits 43:60 should count. Values: RWSM_READ_TO_WRITE_SAME_MASTER=>0b000 RWDM_READ_TO_WRITE_DIFFERENT_MASTER=>0b001 RWXX_READ_TO_WRITE=>0b010 WRSM_WRITE_TO_READ_SAME_MASTER=>0b011 WRDM_WRITE_TO_READ_DIFFERENT_MASTER=>0b100 WRXX_WRITE_TO_READ=>0b101 RRDM_READ_TO_READ_DIFFERENT_MASTER=>0b110 WWDM_WRITE_TO_WRITE_DIFFERENT_MASTER=>0b111

Register Name	***MBA Error Injection***
Mnemonic	MBU.MBA23.MBA_WRD.MBA_INJQ
Address	0000000003010C48 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RWX	MBA_INJQ_CFG_RDTAG_ERR_INJ: Self resetting bit. Writing a one will send a rdtag error inject pulse. After the pulse is sent it will be reset to 0
1	RWX	MBA_INJQ_CFG_RRQ_POP_ERR_INJ: Self resetting bit. Writing a one will send a rrq pop error inject pulse. After the pulse is sent it will be reset to 0
2	RW	MBA_INJQ_CFG_WR_ECC_INJ_MODE: Inject mode for write data ECC injection. Values: SINGLE_SHOT=>0b0 CONTINUOUS=>0b1
3	RW	MBA_INJQ_CFG_WR_ECC_ERR_INJ: Inject enable. The write inject type (CE, UE, etc..) and specific write data bit(s) corrupted are indicated by the MBA Error Control Register. For single shot mode, bit must be cleared and re-set to enable another error inject. For continuous mode, error injection will occur on valid operations until bit is cleared.

Bits	SCOM	Field Mnemonic: Description
4	RW	MBA_INJQ_CFG_WRD_BUFF_INJ_MODE: Inject mode for write re-order data buffer ECC Values: SINGLE_SHOT=>0b0 CONTINUOUS=>0b1
5	RW	MBA_INJQ_CFG_WRD_BUFFER_CE_INJ: Inject CE error into write reorder data buffer. For single shot mode, but must be cleared and reset to enable another error inject. For continuous mode, error injection will occur on valid operations until bit is cleared. Values: NO_CE_ECC_INJECT_INTO_WRITE_REORDER_DATA_BUFFER=>0b0 CE_ECC_INJECT_INTO_WRITE_REORDER_DATA_BUFFER_BASED_ON_INJ_MODE=>0b1
6	RW	MBA_INJQ_CFG_WRD_BUFFER_UE_INJ: Inject UE error into write reorder data buffer. For single shot mode, but must be cleared and reset to enable another error inject. For continuous mode, error injection will occur on valid operations until bit is cleared. Values: NO_UE_ECC_INJECT_INTO_WRITE_REORDER_DATA_BUFFER=>0b0 UE_ECC_INJECT_INTO_WRITE_REORDER_DATA_BUFFER_BASED_ON_INJ_MODE=>0b1

Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBASCTLQ_STOP_ETE_NOW: Stop on ete immediate, attention set when ete occurs When set, a scrubread op will immediately stop when an Error Threshold Equal (ETE) condition is detected.
1	RW	MBASCTLQ_STOP_ETE_RANK_END: Stop on ete end of rank When set, a scrubread op will stop at the end of the current rank, when an Error Threshold Equal condition is detected. Attention is set at the end of the rank.
2	RW	MBASCTLQ_STOP_NCE_HARD: Stop on Hard NCE ETE When set, a scrubread op will stop (immediate or end of rank) when a Hard NCE threshold equal error is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
3	RW	MBASCTLQ_STOP_NCE_INTERMITTENT: Stop on Intermittent NCE ETE When set, a scrubread op will stop (immediate or end of rank) when an Intermittent NCE threshold equal error is detected.. Stop immediately or at end of rank is determined with bits 0 and 1.
4	RW	MBASCTLQ_STOP_NCE_SOFT: Stop on Soft NCE ETE When set, a scrubread op will stop (immediate or end of rank) when a Soft NCE threshold equal error is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
5	RW	MBASCTLQ_STOP_SCE: Stop on SCE When set, a scrubread op will stop (immediate or end of rank) when a SCE is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
6	RW	MBASCTLQ_STOP_MCE: Stop on MCE When set, a scrubread op will stop (immediate or end of rank) when a MCE is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
7	RW	MBASCTLQ_STOP_RETRYCE: Stop on Retry CE ETE When set, a scrubread op will stop (immediate or end of rank) when a Retry CE threshold equal error is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
8	RW	MBASCTLQ_STOP_MPE: Stop on MPE When set, a scrubread op will stop (immediate or end of rank) when a Mark Place Error is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
9	RW	MBASCTLQ_STOP_UE: Stop on UE When set, a scrubread op will stop (immediate or end of rank) when a SD UE is detected. Stop immediately or at end of rank is determined with bits 0 and 1.
10	RW	MBASCTLQ_STOP_ON_END_ADDRESS: Stop on End Address When set, any multi-address maintenance operation will stop when the MBMACA value equals the MBMEA (end address) value. When unset, it will continue to increment pass the end address.
11	RW	MBASCTLQ_ENABLE_ATT_MAINT_CMD_DONE: When set, the Maintenance Complete Attention is set when a maintenance operation stops (immediate or end of rank)
12	RW	MBASCTLQ_STOP_SUE: Stop on SUE When set, a scrubread op will stop (immediate or end of rank) when a SUE is detected. Stop immediately or at end of rank is determined with bits 0 and 1.

Bits	SCOM	Field Mnemonic: Description
13:14	RW	MBASCTLQ_CMD_TIMEOUT_SEL: Command Timeout Select - selects the time interval for a maint command to be sent out before it times out Values: 262144_CYCLES=>0b00 1048576_CYCLES=>0b01 2097152_CYCLES=>0b10 4194304_CYCLES=>0b11
15	RW	MBASCTLQ_RESET_KEEPER: Reset Keeper Writing this bit to 1 will pulse the reset of the hold latched in the MBA c_err_rpt's
16	RW	MBASCTLQ_MBSPA_BIT_0_MODE: MBSPA Bit 0 mode When unset, MBSPA(0) is set ONLY when a maintenance command completes successfully without hitting a stop-on-error condition. When set, MBSPA(0) is set when a maintenance command stops (whether from a command complete or stop-on-error condition).

Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR0_19_MA_B_ADDRESS: DDR Row and Column Address (Addr 0 - Addr 15) For DDR4: Addr 14 - 15 is Addr 17 & BG1
16	RW	CCS_INST_ARR0_19_DDR_RESETN: DDR Resetn Only valid when bit 60 of the ccs_modeq is set to 1. Otherwise, ccs_modeq(24) will control the value of DDR Resetn.
17:19	RW	CCS_INST_ARR0_19_MA_B_BANK: DDR Bank Address For DDR3: Bank 0 - Bank 2 For DDR4: B0, B1, BG0
20	RW	CCS_INST_ARR0_19_MA_B_ACTIVATE: DDR4 Activate
21	RW	CCS_INST_ARR0_19_MA_B_RASN: DDR RAS#
22	RW	CCS_INST_ARR0_19_MA_B_CASN: DDR CAS#
23	RW	CCS_INST_ARR0_19_MA_B_WEN: DDR Write Enable (WE#)

Bits	SCOM	Field Mnemonic: Description
24:31	RW	CCS_INST_ARR0_19_MA_B_CKE: Memory Buffer Mode Port A DDR CKE(0:1) (ma0_cntl_cke(0:1), CKE(4:5) (ma1_cntl_cke(0:1), Port B DDR CKE(0:1) (mb0_cntl_cke(0:1), CKE(4:5) (mb1_cntl_cke(0:1) Note that Port A CKE(0:1) is copied to Port A CKE(2:3), Port A CKE(4:5) is copied to Port A CKE(6:7), Port B CKE(0:1) is copied to Port B CKE(2:3) and Port B CKE(4:5) copied to Port B CKE(6:7) when bit 26 of CCS_MODEQ is set. Salerno Mode CKE(0:1) is slot 0 CKE(2:3) is slot 1 CKE(4:5) is slot 2 CKE(6:7) are spares
32:47	RW	CCS_INST_ARR0_19_MA_B_CSN: Memory Buffer Mode Port A DDR CSN(0:3) ma0_cntl_csn(0:3) CSN(4:7) ma1_cntl_csn(0:3) Port B DDR CSN(0:3) mb0_cntl_csn(0:3) CSN(4:7) mb1_cntl_csn(0:3) Salerno Mode CSN(0:3) is slot 0 CSN(4:7) is slot 1 CSN(8:11) is slot 2 CSN(12:15) are spares
48:55	RW	CCS_INST_ARR0_19_MA_B_ODT: Memory Buffer Mode Port A ODT ODT(0:1) ma0_cntl_odt(0:1) ODT(0:1) ma1_cntl_odt(0:1) Port B ODT ODT(0:1) mb0_cntl_odt(0:1) ODT(0:1) mb1_cntl_odt(0:1) Salerno Mode ODT(0:1) is slot 0 ODT(2:3) is slot 1 ODT(4:5) is slot 2 ODT(6:7) are spares
56:59	RW	CCS_INST_ARR0_19_DDR_CALIBRATION_TYPE: Bits 0:1 define the calibration type. Bits 2:3 define the sub-type 0123 11xx Initial Calibration. Performs all of the following steps that are enabled via configuration register: SysclkRdclk alignment, DQS alignment, Read Eye MPR Centering, Write leveling, Write centering, Coarse rdwr alignment, Read Eye Custom Pattern Centering. 10xx Internal ZQ calibration (cal_rank ignored) 01xx External ZQ calbration. Requested rank is ZQ Cal'd 0000 Periodic Calibration. SysClkRdClk alignment Step 0001 Periodic Calibration: DQS alignment Step 0010 Periodic Calibration: Read Eye MPR Centering Step
60	RW	CCS_INST_ARR0_19_DDR_PARITY: DDR Parity Only valid when bit 61 of the ccs_modeq is set to 1. Otherwise, parity is calculated by the hardware.
61:63	RW	CCS_INST_ARR0_19_RESERVED_61_63: Reserved

Register Name	***CCS Instruction Array 0 20***

56:59	RW	CCS_INST_ARR0_31_DDR_CALIBRATION_TYPE: Bits 0:1 define the calibration type. Bits 2:3 define the sub-type 0123 11xx Initial Calibration. Performs all of the following steps that are enabled via configuration register: SysclkRdclk alignment, DQS alignment, Read Eye MPR Centering, Write leveling, Write centering, Coarse rdwr alignment, Read Eye Custom Pattern Centering. 10xx Internal ZQ calibration (cal_rank ignored) 01xx External ZQ calbration. Requested rank is ZQ Cal'd 0000 Periodic Calibration. SysClkRdClk alignment Step 0001 Periodic Calibration: DQS alignment Step 0010 Periodic Calibration: Read Eye MPR Centering Step
60	RW	CCS_INST_ARR0_31_DDR_PARITY: DDR Parity Only valid when bit 61 of the ccs_modeq is set to 1. Otherwise, parity is calculated by the hardware.
61:63	RW	CCS_INST_ARR0_31_RESERVED_61_63: Reserved

Register Name	***CCS Instruction Array 1 0***
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_0
Address	0000000003010E35 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_0_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_0_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_0_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_0_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_0_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_0_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_0_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_0_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 1*
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_1
Address	0000000003010E36 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_1_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_1_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_1_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_1_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_1_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_1_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_1_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_1_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 2*
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_2
Address	0000000003010E37 (SCOM)

Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_3_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_3_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_3_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_3_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_3_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_3_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_3_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_3_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 4*
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_4
Address	0000000003010E39 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_4_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_4_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_4_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_4_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_4_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_4_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_4_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_4_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 5*
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_5
Address	0000000003010E3A (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_5_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_5_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_5_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_5_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_5_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_5_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_5_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_5_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 6*
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_6
Address	0000000003010E3B (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_6_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_6_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_6_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_6_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_6_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_6_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_6_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_6_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 7*
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_7
Address	0000000003010E3C (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_7_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_7_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_7_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_7_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_7_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_7_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_7_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_7_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 8*
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_8
Address	0000000003010E3D (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:15	RW	CCS_INST_ARR1_8_IDLES: Number of Idle cycles before issuing next command
16:31	RW	CCS_INST_ARR1_8_REPEAT_CMD_CNT: Repeat this command this many times.
32:51	RW	CCS_INST_ARR1_8_READ_OR_WRITE_DATA: Write Data(0:19) if write command is coded up or Read Compare Byte if read command is coded up (Each bit represents a nibble of data)
52	RW	CCS_INST_ARR1_8_READ_COMPARE_REQUIRED: Set to 1b if this command is read and requires Data compare
53:56	RW	CCS_INST_ARR1_8_DDR_CAL_RANK: DDR Rank Address(0:3) to Calibrate
57	RW	CCS_INST_ARR1_8_DDR_CALIBRATION_ENABLE: Set to 1b to enable the calibration type in bit 56:59 in CCS Instruction Array 0
58	RW	CCS_INST_ARR1_8_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_8_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*CCS Instruction Array 1 9*
Mnemonic	MBU.MBA23.MBA_MCBIST.CCS.CCS_INST_ARR1_9

58	RW	CCS_INST_ARR1_31_CCS_END: Set to 1b if this is the last CCS command.
59:63	RW	CCS_INST_ARR1_31_GOTO_CMD: If CCS Instruction Array 1 bit 58 is 0b, Goto this command number next (after repeat count has expired).

Register Name	*Configured Command Sequence Control Register*
Mnemonic	MBU.MBA23.MBA_MCBIST.SCOMFIR.CCS_CNTLQ
Address	0000000003010EA5 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RWX	CCS_CNTLQ_CCS_START: Start bit - Self resetting bit. Kicks off the CCS operation
1	RWX	CCS_CNTLQ_CCS_STOP: Stop bit - Self resetting bit. Stops Current CCS operation
2:63	RO	constant=0b00000000000000000000000000000000000000000000000000000000000000

Register Name	*Configured Command Sequence Status Register*
Mnemonic	MBU.MBA23.MBA_MCBIST.SCOMFIR.CCS_STATQ
Address	0000000003010EA6 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RWX	CCS_STATQ_CCS_IP: IP bit - Hdw sets to a '1'b when CCS run in progress
1	RWX	CCS_STATQ_CCS_DONE: Done bit - Hdw sets to a '1'b when CCS run complete
2	RWX	CCS_STATQ_CCS_FAIL: Fail bit - Hdw sets to a '1'b when CCS run failed
3:5	RWX	CCS_STATQ_CCS_FAIL_TYPE: Fail Type - Indicates type of CCS failure: Bit 3-> Read Miscompare Bit 4 -> UE or SUE Error Bit 5 -> Calibration operation times out

Bits	SCOM	Field Mnemonic: Description
6:63	RO	constant=0b00000000000000000000000000000000000000000000000000000000000000

Register Name	*Configured Command Sequence Mode Register*
Mnemonic	MBU.MBA23.MBA_MCBIST.SCOMFIR.CCS_MODEQ
Address	0000000003010EA7 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	CCS_MODEQ_CCS_STOP_ON_ERR: User sets to a '1'b to tell the Hdw to stop CCS whenever failure occurs. When a '0'b, Hdw will continue CCS even if a failure occurs.
1	RW	CCS_MODEQ_CCS_UE_DISABLE: User sets to a '1'b to force the Hdw to ignore any array ue or sue errors during CCS command fetching.
2:3	RW	CCS_MODEQ_CCS_DATA_SEL: User sets to indicate which group of the data burst to compare. Values: DDR_BURST_1_AND_2=>0b00 DDR_BURST_3_AND_4=>0b01 DDR_BURST_5_AND_6=>0b10 DDR_BURST_7_AND_8=>0b11
4:5	RW	CCS_MODEQ_MCBIST_DDR_DPHY_NCLK: DDR Phy nclk control Values: PHY_NCLK_OUTPUT_DISABLED=>0b00 PHY_NCLK_OUTPUT_ENABLED=>0b01
6:7	RW	CCS_MODEQ_MCBIST_DDR_DPHY_PCLK: DDR Phy pclk control Values: PHY_PCLK_OUTPUT_DISABLED=>0b00 PHY_PCLK_OUTPUT_ENABLED=>0b10
8:23	RW	CCS_MODEQ_DDR_CAL_TIMEOUT_CNT: DDR calibration time counter - amount of time to wait for DDR calibration to complete. This value is multiplied by the factor in bits 30:31 to get the total timeout wait time.
24	RW	CCS_MODEQ_MCBIST_DDR_RESETN: DDR Resetn Signal
25	RW	CCS_MODEQ_MCBIST_DDR_DFI_RESET_RECOVER: DDR Reset Recover Signal
26	RW	CCS_MODEQ_COPY_CKE_TO_SPARE_CKE: Copy CKE signals to CKE Spare on both ports 0 - Spare CKEs not copied with values from CKE(0:1) and CKE(4:5) 1 - Port A CKE(0:1) copied to Port A CKE(2:3), Port A CKE(4:5) copied to Port A CKE(6:7), Port B CKE(0:1) copied to Port B CKE(2:3) and Port B CKE(4:5) copied to Port B CKE(6:7)
27	RW	CCS_MODEQ_DISABLE_ECC_ARRAY_CHK: Disable ecc checking on the CCS arrays 0 - ECC checking on 1 - ECC checking off
28	RW	CCS_MODEQ_DISABLE_ECC_ARRAY_CORRECTION: Disable ecc correction on the CCS arrays 0 - ECC correction on 1 - ECC correction off
29	RW	CCS_MODEQ_CCS_ADDR_MUX_SEL: CCS Address Mux Sel - This bit should be turned on until all multiple CCS instructions are completed. 0 - selects address data from mainline logic 1 - selects address data from CCS logic
30:31	RW	CCS_MODEQ_DDR_CAL_TIMEOUT_CNT_MULT: DDR calibration time counter multiplication factor. This value is multiplied by the counter in bits 8:23 to get the total timeout wait time. Values: 1_CCS_CYCLE=>0b00 512_CCS_CYCLES=>0b01 32768_CCS_CYCLES=>0b10 1073741824_CCS_CYCLES=>0b11
32:47	RW	CCS_MODEQ_MA_B_ADDRESS_IDLE_PAT: DDR Row and Column Address Idle Pattern (Addr 0 - Addr 15) For DDR4: Addr 14 - 15 is Addr 17 & BG1

Bits	SCOM	Field Mnemonic: Description
48:50	RW	CCS_MODEQ_MA_B_BANK_IDLE_PAT: DDR Bank Address Idle Pattern For DDR3: Bank 0 - Bank 2 For DDR4: B0, B1, BG0
51	RW	CCS_MODEQ_MA_B_ACTIVATE_IDLE_PAT: DDR4 Activate Idle Pattern
52	RW	CCS_MODEQ_MA_B_RASN_IDLE_PAT: DDR RAS# Idle Pattern
53	RW	CCS_MODEQ_MA_B_CASN_IDLE_PAT: DDR CAS# Idle Pattern
54	RW	CCS_MODEQ_MA_B_WEN_IDLE_PAT: DDR Write Enable (WE#) Idle Pattern
55	RW	CCS_MODEQ_NTTM_MODE: Non Traditional Transparent Mode When set to 1, limited non-traditional read and write operations can be done.
56:59	RW	CCS_MODEQ_NTTM_RW_DATA_DLY: Non Traditional Transparent ReadWrite Delay Use to delay the Write data start pulse or Read Data capture pulse to the DDR Phys. Maximum delay of 15 cycles is possible.
60	RW	CCS_MODEQ_DDR_RESETN_ENABLE: DDR Resetn Enabled When set to 1, bit 16 of the CCS_INST_ARR0 will be driven out to DDR Resetn. When set to 0, ccs_modeq(24) will be driven out to DDR Resetn.
61	RW	CCS_MODEQ_DDR_PARITY_ENABLE: DDR Parity Enabled When set to 1, bit 60 of the CCS_INST_ARR0 will be driven out to DDR parity. When set to 0, the hardware calculates the parity.
62	RW	CCS_MODEQ_GP_BIT_3_ENABLE: GP bit 3 enable (force_mclk_low) When set to 1, the inverted value of GP(3) will be driven on the force_mclk_low signal to the DDR PHYs. When set to 0, the value of inverted value of ccs_modeq(63) will be driven on the force_mclk_low signal to the DDR PHYs
63	RW	CCS_MODEQ_FORCE_MCLK_LOW_N: force_mclk_low_n When set to 0, a '1' will be driven on the force_mclk_low signal to the DDR PHYs. When set to 1, the inverted value of ccs_modeq(63) will be driven on the force_mclk_low signal to the DDR PHYs

Register Name	***MCBIST Memory Parameter Register***
Mnemonic	MBU.MBA23.MBA_MCBIST.SCOMFIR.MCBPARMQ
Address	0000000003010EAF (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:49	RW	MCBPARMQ_RESERVED_0_49: Not used
50:52	RW	MCBPARMQ_CFG_RANDCMD_WGT: Specifies the weighting of random commands as follows (%Read %Write): Values: 12_87=>0b000 25_75=>0b001 50_50=>0b010 75_25=>0b011 87_12=>0b100
53:59	RW	MCBPARMQ_CFG_MIN_CMD_GAP: This is the minimum number of cycles between commands when cfg_en_randcmd_gap is a 0. If cfg_en_randcmd_gap is a 1 this becomes a 7 bit seed for the LFSR that randomly generates the gap intervals between 1-127. A value of all zeros will force MCBIST to issues commands as fast as possible.
60	RW	MCBPARMQ_CFG_EN_RANDCMD_GAP: When set to a 1 random command gaps from 1-1023 cycles are enabled and cfg_min_cmd_gap is disabled and becomes a seed for a LFSR that is randomly generating 1-127 cycle gaps (there is another 8 bit LFSR that is generating a 1-8 cycle multiplier).
61:62	RW	MCBPARMQ_CFG_RANDGAP_WGT: Forces the following command gap intervals when cfg_en_randcmd_gap is a 1: 00: 1 to 1023 cycles. 01: 1 to 511 cycles. 10: 1 to 255 cycles. 11: 1 to 127 cycles.
63	RW	MCBPARMQ_CFG_BC4_EN: BC4 enable When set, it enables BC4 data mode. This configuration cannot be use in ECC data mode.

Register Name	***MCBIST Runtime Counter Register***
Mnemonic	MBU.MBA23.MBA_MCBIST.SCOMFIR.RUNTIMECTRQ
Address	0000000003010EB0 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:36	RWX	RUNTIMECTRQ_CFG_RUNTIME_CTR: This is the runtime counter facility. This 37 bit counter will increment every 4 memory clock cycles which gives it a maximum value of 687 seconds at 800 MHz or 824 seconds at 667 MHz.
37:63	RO	constant=0b00000000000000000000000000000

Register Name	***MCBIST Refresh Control Register***
Mnemonic	MBU.MBA23.MBA_MCBIST.SCOMFIR.MCBRCRQ
Address	0000000003010EB1 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:31	RW	MCBRCRQ_RESERVED_0_31: Not used
32	RW	MCBRCRQ_CFG_RUNTIME_MCBALL: Configures what the runtime counter counts: Values: JUST_ONE_SUBTEST=>0b0 FULL_MCBIST_RUN=>0b1
33:37	RW	MCBRCRQ_CFG_RUNTIME_SUBTEST: If bit 32 is a 0, these bits represent the subtest number that should be counted.

Bits	SCOM	Field Mnemonic: Description
38	RW	MCBRCRQ_CFG_RUNTIME_OVERHEAD: If bit 32 is a 1, this bit configures the starting point of the runtime counter: Values: WITHOUT_OVERHEAD_WAIT_UNTIL_SUBTEST_0_IS_STARTED=>0b0 WITH_OVERHEAD_AS_SOON_AS_MCBIST_LEAVES_THE_IDLE_STATE=>0b1
39	RW	MCBRCRQ_RESERVED_39: Not used

Register Name	*Port A Address Generator Configuration Register*
Mnemonic	MBU.MBA23.MBA_MCBIST.SCOMFIR.MCBAGRAQ
Address	0000000003010ED6 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:5	RW	MCBAGRAQ_CFG_FIXED_WIDTH_A0: Sets the number of fixed slots in the address generator for Port A, socket A0. This will cause the bits from (MSB to MSB+cfg_fixed_width_a0-1) to not be included in the address generation. Used in conjunction with the configurable address map registers. Example: Fixed Rank, Fixed Bank, Fixed Row = 3 + 3 + 16 = 22 Program 0x16 Defaulted to a fixed Rank setting - Don needs to check this
6:11	RW	MCBAGRAQ_CFG_FIXED_WIDTH_A1: Sets the number of fixed slots in the address generator for Port A, socket A1. This will cause the bits from (MSB to MSB+cfg_fixed_width_a1-1) to not be included in the address generation. Used in conjunction with the configurable address map registers. Example: Fixed Rank, Fixed Bank, Fixed Row = 3 + 3 + 16 = 22 Program 0x16 Defaulted to a fixed Rank setting - Don needs to check this
12:15	RW	MCBAGRAQ_CFG_PORTA0_RATIO: Programs how often Port A, socket A0 addresses need to be generated relative to Port A, socket A1 addresses. Ratios can be set anywhere from [1-15] : [1-15]. Used for Deterministic address weighting.
16:19	RW	MCBAGRAQ_CFG_PORTA1_RATIO: Programs how often Port A, socket A1 addresses need to be generated relative to Port A, socket A0 addresses. Ratios can be set anywhere from [1-15] : [1-15]. Used for Deterministic address weighting.
20:22	RW	MCBAGRAQ_CFG_RANDPORT_WGT_A: Specify the weighting of A0A1 port accesses. A B 000 - 12.5 87.5 001 - 25 75 010 - 50 50 011 - 75 25 100 - 87.5 12.5
23	RW	MCBAGRAQ_CFG_DET_RAND_WGT_A: 0 - Use deterministic ratio to switch between socket A0 and socket A1 1 - Use random weighted ratio to switch between socket A0 and socket A1
24:25	RW	MCBAGRAQ_CFG_PORTA_SCKT_PPLTD: Socket Populated Values: SOCKET_A0_AND_SOCKET_A1_ARE_NOT_POPULATED=>0b00 ONLY_SOCKET_A1_IS_POPULATED=>0b01 ONLY_SOCKET_A0_IS_POPULATED=>0b10 SOCKET_A0_AND_SOCKET_A1_ARE_BOTH_POPULATED=>0b11

53	ROX	TRACE_RUNNING: Trace Run indicator
54:63	ROX	TRACE_HOLD_ADDRESS: Trace Hold Address (pointing to last entry)

Register Name	*Configuration Of CC Counters*
Mnemonic	TCM.SYNC_CONFIG
Address	0000000003030000 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	ISLE_XSTOP_MASK_B: mask for clockstop of all island clocks on xstop from chiplet
1	RW	PCB_XSTOP_MASK_B: mask for clockstop of all island clocks on xstop from pcb
2	RW	CLKSTP_SYNC_EN: stop clocks aligned to sync pulse
3	RW	EDRAM_XSTOP_MASK_B: mask for clockstop of eDRAM clock on any xstop
4	RW	PLL_XSTOP_MASK_B: mask for clockstop of pll clock on any xstop
5	RW	LOCAL_XSTOP_MASK_B: mask for clockstop of all island clocks on local xstop from chiplet
6	RW	DISABLE_PCB_ITR: disable interrupt generation within CC
7	RW	USE_SYNC_FOR_SCAN: if set, use opcg initial alignment for scan requests
8	RW	KEEP_EDRAM_ON_XSTOP: keep eDRAM enabled when a checkstop occurs
9	RW	TRIGGER_OPCG_ON_XSTOP: trigger opcg on xstop instead of performing clockstop

Bits	PCB	Field Mnemonic: Description
10	RW	SEL_EXT_OPCG_TRIGGER: select external OPCG trigger (set OPCG in slave mode)
11	RW	LISTEN_TO_SYNC_PULSE: enable phase counter synchronization by sync_pulse signal
12	RW	SYNC_CLK_START_ENABLE: enable clk start driven by tc_sync_clk_stop (falling edge)
13	RW	SYNC_CLK_STOP_ENABLE: enable clk stop driven by tc_sync_clk_stop (rising_edge)
14	RWX_WOR	CHIP_PROTECTION_ENABLE: Memory Buffer only - can only be set, but not cleared via PCB. When this bit is SET, no clock starts are possible
15	RW	SPARE15: spare
16	RW	SPARE16: spare
17	RW	SPARE17: spare
18	RW	SPARE18: spare
19	RW	SPARE19: spare
20	RW	SPARE20: spare

Register Name	***Counter Offset***
Mnemonic	TCM.PHASE_SHADOW
Address	0000000003030001 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RWX	PHASE_COUNT_SHADOW_Q: offset for sync counter
6	RO	constant=0b0

Register Name	***OPCG Control Register 0***
Mnemonic	TCM.OPCG_REG0
Address	0000000003030002 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	RUNN_MODE: runn-mode if 1 or BIST mode if 0
1	RWX	OPCG_GO: opcg go (start sequence)
2	RWX	RUN_SCAN0: run scan0 (will override all BIST mode settings but the scan_ratio)
3	RW	SCAN0_MODE: set PRPGs in scan0_mode but do not run automatic scan0 sequence
4:8	RW	SCAN_RATIO: scan_ratio (n=0-15: (n+1):1, 16: 24:1, 17: 32:1, 18: 48:1, 19: 64:1, 20: 128:1)
9	RW	INOP_FORCE_SG: Set SG high during INOP
10:13	RW	INOP_ALIGN: INOP phase alignment (0: none, 1: 2:1, 2: 3:1, 3: 4:1, 4: 6:1, 5: 8:1, 6: 12:1, 7: 16:1, 8: 24:1)
14:20	RW	INOP_WAIT: INOP cycle delay (1-127)
21:24	RWX	SNOP_ALIGN: BIST mode: SNOP phase alignment (like INOP), runn-mode: loopcnt(0:3)
25:27	RWX	SNOP_WAIT: BIST mode: SNOP cycle delay (0-7), runn-mode: loopcnt(4:6)
28:31	RWX	ENOP_ALIGN: BIST mode: ENOP phase alignment (like INOP), runn-mode: loopcnt(7:10)

Bits	PCB	Field Mnemonic: Description
32:34	RWX	ENOP_WAIT: BIST mode: ENOP cycle delay (0-7), runn-mode: loopcnt(11:13)
35	RWX	ENOP_FORCE_SG: BIST mode: Set SG high during ENOP, runn-mode: loopcnt(14)
36:63	RWX	LOOP_COUNT: BIST mode: loop count (l = 1-2^28 (about 5 minutes LBIST)), runn-mode: loopcnt(15:42)

Register Name	***OPCG Control Register 1***
Mnemonic	TCM.OPCG_REG1
Address	0000000003030003 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:3	RW	FUNC_CAPT_COUNT: BIST mode: capture cycles (1-12) encoded as capture cycle - 1
4:43	RW	FUNC_CAPT_INSTR_F: BIST mode: functional capture Instr 0-7 f domain (sl, nsl, ary, sg, fce)
44:63	RW	FUNC_CAPT_INSTR_FBY2: BIST mode: functional capture Instr 0-3 f/2 domain (sl, nsl, ary, sg, fce)

Register Name	***OPCG Control Register 2***
Mnemonic	TCM.OPCG_REG2
Address	0000000003030004 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:11	RW	SCAN_COUNT: BIST mode: Channel scan count (s = 0-4095) runn-mode: start_abist match value(0:11)
12:23	RW	MISR_A_VAL: BIST mode: a value for MISR aperture, runn-mode: start_abist match value(12:23)
24:35	RW	MISR_B_VAL: BIST mode: b value for MISR aperture, runn-mode: start_abist match value(24:35)
36:47	RW	MISR_INIT_WAIT: BIST mode: delay MISR aperture, MISRs get active after this number of loops
48	RW	SCAN_CLK_USE_EVEN: BIST mode: Generate scan clock in f odd cycle. runn-mode: run one additional clock in f domain
49:51	RW	OPCG_PAD_VALUE: After setting all DC signals, wait this many number of cycle x 16 before applying tholds
52	RW	USE_F_AND_FDIV2: BIST mode: if 1, use 8 f and 4 f/2 pattern concurrently, else use 1-12 local mesh patterns
53	RW	USE_ARY_CLK_DURING_FILL: BIST mode: Fire nsl_ary_clock during NSL-fill runn-mode: stop run-n on xstop
54	RW	SG_HIGH_DURING_FILL: BIST mode: Hold SG high during NSL-fill and SNOP runn-mode: OPCG engine controls start_abist (overrides GP0 setting)
55	RW	RTIM_THOLD_FORCE: force rtim_thold low when not in test_dc mode (must be 0 at all time)
56	RW	LBIST_SKITTER_CTL: BIST mode: 0: enable skitter during lbist_ip, 1: enable skitter when misr_active
57	RW	MISR_MODE: BIST mode: MISR aperture mode (0: a-1 to b-1, 1: start to a and b to end)
58	RW	INFINITE_MODE: infinite mode
59:63	RW	NSL_FILL_COUNT: BIST mode: NSL-fill count (0-31)

Register Name	*Opcg Start Register*
Mnemonic	TCM.OPCG_REG3
Address	0000000003030005 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RWX	OPCG_GO2: opcg go for broadcast sequences (start sequence)
1	RW	RUN_OPCG_ON_UPDATE_DR: start opcg engine when scan updated (update_dr) received (set pulse)
2	RW	RUN_OPCG_ON_CAPTURE_DR: start opcg engine when scan updated (capture_dr) received (set pulse)
3:4	RW	ALIGN_SOURCE_SELECT: 0: use inopa setting from opcg_reg0, 1: use rising edge of sync pulse, 2: use input from unit (for AVP)
5:7	RW	PRPG_WEIGHTING: prpg_activate: 1/2, 1/4, 1/8, 1/16, 1/2, 3/4, 7/8, 15/16
8:19	RWX	PRPG_VALUE: set to 0 for prpg always on, else seed
20	RW	EXTEND_INOPW_ENOPW: extend I/ENOPW: add 256 cycles if i/enop>0, else 257+max i/enop
21	RW	EXTEND_SNOPW: add 256 cycles if snop>0, else 257+max snop
22	RW	FORCE_SG_HIGH_DURING_SNOP: force sg high during snop
23:31	RW	CHKSW: reserved for debug switch (keep 0 unless chows required)
32:43	RW	PRPG_A_VAL: a value for PRPG aperture
44:55	RW	PRPG_B_VAL: b value for PRPG aperture
56	RW	PRPG_MODE: PRPG aperture mode (0: a-1 to b-1, 1: start to a and b to end)
57:63	RW	SPARE3: spares

Register Name	*Start/stop Of Clocks*
Mnemonic	TCM.CLK_REGION
Address	0000000003030006 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:1	RWX	CLOCK_CMD: command for clock control: 00 NOP 01 START 10 STOP 11 PULSE (one pulse)
2:3	RO	constant=0b00
4	RWX	CLOCK_REGION_PERV: for clock region perv (Pervasive)
5	RWX	CLOCK_REGION_FASTUNIT0: for clock region memn
6	RWX	CLOCK_REGION_FASTUNIT1: for clock region mems
7	RWX	CLOCK_REGION_UNIT2: for clock region mte
8	RWX	CLOCK_REGION_UNIT3: for clock region ddrn
9	RWX	CLOCK_REGION_UNIT4: for clock region ddrs
10	RWX	CLOCK_REGION_UNIT5: for clock region unit5 region is UNUSED
11	RWX	CLOCK_REGION_PLL: for clock region pll region is UNUSED
12:19	RO	constant=0b00000000
20	RWX	SEL_THOLD_SL: select sl tholds

Bits	PCB	Field Mnemonic: Description
21	RWX	SEL_THOLD_NSL: select nsl tholds
22	RWX	SEL_THOLD_ARY: select array thold

Register Name	***Scan Region And Type***
Mnemonic	TCM.SCANSELQ
Address	0000000003030007 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:2	RO	constant=0b000
3	RW_WCLRPART	SCANSEL_CLK_VITL: scan clock region vitl (Vital = Clock)
4	RWX	SCANSEL_CLK_PERV: scan clock region perv (Pervasive)
5	RWX	SCANSEL_CLK_FASTUNIT0: scan clock region memn
6	RWX	SCANSEL_CLK_FASTUNIT1: scan clock region mems
7	RWX	SCANSEL_CLK_UNIT2: scan clock region mte
8	RWX	SCANSEL_CLK_UNIT3: scan clock region ddrn
9	RWX	SCANSEL_CLK_UNIT4: scan clock region ddrs
10	RWX	SCANSEL_CLK_UNIT5: scan clock region unit5 region is UNUSED
11	RWX	SCANSEL_CLK_PLL: scan clock region pll region is UNUSED
12:19	RO	constant=0b00000000
20	RW	SCANSEL_FUNC: scan chain func (functional)
21	RW	SCANSEL_CFG: scan chain mode (boot config and debug config)
22	RW	SCANSEL_CCFG_GPTR: scan chain ccfg / gptr (Pervasive: CC config, Others: GPTR)
23	RW	SCANSEL_REGF: scan chain regf (register files)
24	RW	SCANSEL_LBIST: scan chain lbst (LBIST)
25	RW	SCANSEL_ABIST: scan chain abst (ABIST)
26	RW	SCANSEL_REPR: scan chain repr (Array Repair)
27	RW	SCANSEL_TIME: scan chain time (Array Timing)
28	RW	SCANSEL_BNDY_FARY: scan chain bndy (Boundary IOs)
29	RW	SCANSEL_FARR: scan chain farr (fast array unload)
30	RW	SCANSEL_CMSK: scan chain cmsk (lbist channel mask)

Register Name	***Clocks Running***
Mnemonic	TCM.CLOCK_STAT
Address	0000000003030008 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	CLOCK_STATUS_PERV_FUNC_SL: status of perv func_sl_thold 0=run, 1=stop
1	ROX	CLOCK_STATUS_PERV_FUNC_NSL: status of perv func_nsl_thold 0=run, 1=stop
2	ROX	CLOCK_STATUS_PERV_ARY_NSL: status of perv ary_nsl_thold 0=run, 1=stop
3	ROX	CLOCK_STATUS_FASTUNIT0_ODD_FUNC_SL: status of memn_odd func_sl_thold 0=run, 1=stop
4	ROX	CLOCK_STATUS_FASTUNIT0_EVEN_FUNC_SL: status of memn_even func_sl_thold 0=run, 1=stop
5	ROX	CLOCK_STATUS_FASTUNIT0_ODD_FUNC_NSL: status of memn_odd func_nsl_thold 0=run, 1=stop
6	ROX	CLOCK_STATUS_FASTUNIT0_EVEN_FUNC_NSL: status of memn_even func_nsl_thold 0=run, 1=stop
7	ROX	CLOCK_STATUS_FASTUNIT0_ODD_ARY_NSL: status of memn_odd ary_nsl_thold 0=run, 1=stop
8	ROX	CLOCK_STATUS_FASTUNIT0_EVEN_ARY_NSL: status of memn_even ary_nsl_thold 0=run, 1=stop
9	ROX	CLOCK_STATUS_FASTUNIT1_ODD_FUNC_SL: status of mems_odd func_sl_thold 0=run, 1=stop
10	ROX	CLOCK_STATUS_FASTUNIT1_EVEN_FUNC_SL: status of mems_even func_sl_thold 0=run, 1=stop
11	ROX	CLOCK_STATUS_FASTUNIT1_ODD_FUNC_NSL: status of mems_odd func_nsl_thold 0=run, 1=stop
12	ROX	CLOCK_STATUS_FASTUNIT1_EVEN_FUNC_NSL: status of mems_even func_nsl_thold 0=run, 1=stop
13	ROX	CLOCK_STATUS_FASTUNIT1_ODD_ARY_NSL: status of mems_odd ary_nsl_thold 0=run, 1=stop
14	ROX	CLOCK_STATUS_FASTUNIT1_EVEN_ARY_NSL: status of mems_even ary_nsl_thold 0=run, 1=stop
15	ROX	CLOCK_STATUS_UNIT2_FUNC_SL: status of mte func_sl_thold 0=run, 1=stop
16	ROX	CLOCK_STATUS_UNIT2_FUNC_NSL: status of mte func_nsl_thold 0=run, 1=stop
17	ROX	CLOCK_STATUS_UNIT2_ARY_NSL: status of mte ary_nsl_thold 0=run, 1=stop
18	ROX	CLOCK_STATUS_UNIT3_FUNC_SL: status of ddrn func_sl_thold 0=run, 1=stop
19	ROX	CLOCK_STATUS_UNIT3_FUNC_NSL: status of ddrn func_nsl_thold 0=run, 1=stop
20	ROX	CLOCK_STATUS_UNIT3_ARY_NSL: status of ddrn ary_nsl_thold 0=run, 1=stop
21	ROX	CLOCK_STATUS_UNIT4_FUNC_SL: status of ddrs func_sl_thold 0=run, 1=stop
22	ROX	CLOCK_STATUS_UNIT4_FUNC_NSL: status of ddrs func_nsl_thold 0=run, 1=stop
23	ROX	CLOCK_STATUS_UNIT4_ARY_NSL: status of ddrs ary_nsl_thold 0=run, 1=stop
24	ROX	CLOCK_STATUS_UNIT5_FUNC_SL: status of unit5 func_sl_thold 0=run, 1=stop region is UNUSED
25	ROX	CLOCK_STATUS_UNIT5_FUNC_NSL: status of unit5 func_nsl_thold 0=run, 1=stop region is UNUSED
26	ROX	CLOCK_STATUS_UNIT5_ARY_NSL: status of unit5 ary_nsl_thold 0=run, 1=stop region is UNUSED
27	ROX	CLOCK_STATUS_PLL_FUNC_SL: status of pll func_sl_thold 0=run, 1=stop region is UNUSED
28	ROX	CLOCK_STATUS_PLL_FUNC_NSL: status of pll func_nsl_thold 0=run, 1=stop region is UNUSED
29	ROX	CLOCK_STATUS_PLL_ARY_NSL: status of pll ary_nsl_thold 0=run, 1=stop region is UNUSED
30:63	RO	constant=0b11111111111111111111111111111111

Register Name	*Error Status Of CC*
Mnemonic	TCM.ERROR_STATUS
Address	0000000003030009 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RWX	PCB_WRITE_NOT_ALLOWED: PCB access error: write not allowed
1	RWX	PCB_READ_NOT_ALLOWED: PCB access error: read not allowed

Bits	PCB	Field Mnemonic: Description
2	RWX	PCB_PARITY_ERR_ON_CMD: PCB access error: parity error on PCB command
3	RWX	PCB_ADDRESS_NOT_VALID: PCB access error: address not valid
4	RWX	PCB_PARITY_ADDR_ERR: PCB access error: parity error on address
5	RWX	PCB_PARITY_DATA_ERR: PCB access error: parity error on data
6	RWX	PCB_PROTECTED_ACCESS_INVALID: PCB access error: protection violation
7	RWX	PCB_PARITY_SPCIF_ERR: parity error from special packet interface
8	RWX	PCB_WRITE_AND_OPCG: PCB write while opcg in progress
9	RWX	CLOCK_CMD_CONFLICT: clock command conflict: previous one was not yet completed (includes those triggered by tc_sync_clk_stop)
10	RWX	SCAN_COLLISION: scan collision - high when scan protection error occurred
11	RWX	OPCG_TRIGGER_ERROR: opcg triggered while in progress
12	RWX	OPCG_PARITY_ERROR: opcg state machine parity error - during test its ok, but in system its a error
13	RWX	PHASE_CNT_CORRUPTED: phase hold counter corruption detected
14:15	RWX	CC_PAR_ERR: parity error in CC registers (1. opcg & sync config parity error, 2. clock mux parity error)
16	RWX	GPIO_PAR_ERR: parity error in GP0 register
17	RWX	SECURITY_VIOLATION: security_violation - when Chip protection is active and you try a clock start, pulse, which is invalid at this time

Register Name	***CC Protect Mode Register***
Mnemonic	TCM.CC_PROTECT_MODE_REG
Address	00000000030303FE (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	CC_READ_PROTECT_ENABLE: Enable read protection
1	RW	CC_WRITE_PROTECT_ENABLE: Enable write protection

Register Name	***Atomic Lock Register***
Mnemonic	TCM.CC_ATOMIC_LOCK_REG
Address	00000000030303FF (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	CC_ATOMIC_LOCK_ENABLE: Enable atomic lock
1:4	ROX	CC_ATOMIC_ID: Atomic ID

Register Name	***Global Checkstop FIR***
Mnemonic	TCM.XFIR
Address	0000000003040000 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RWX	XFIR_IN0: summary bit(any xstop)
1	RWX	XFIR_IN1: xstop from other chiplets
2	RWX	XFIR_IN2: unused
3	RWX	XFIR_IN3: xstop pervasive unit
4	RWX	XFIR_IN4: unused
5	RWX	XFIR_IN5: xstop from memn0
6	RWX	XFIR_IN6: xstop from memn1
7	RWX	XFIR_IN7: xstop from mems0
8	RWX	XFIR_IN8: xstop from mems1
9	RWX	XFIR_IN9: xstop from ddrn
10	RWX	XFIR_IN10: xstop from ddrs
11	RWX	XFIR_IN11: xstop from fbistm
12	RWX	XFIR_IN12: xstop from mba01 secure fir
13	RWX	XFIR_IN13: xstop from mba23 secure fir
14	RWX	XFIR_IN14: unused
15:25	RWX	XFIR_IN15: unused
26	RWX	XFIR_IN26: xstop on debug trigger

Register Name	***Global Recoverable FIR***
Mnemonic	TCM.RFIR
Address	0000000003040001 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	RFIR_IN0: unused
1	ROX	LFIR_RECOV_ERR: error from local LFIR
2:23	ROX	RFIR_IN: recoverable errors: same mapping as XFIR(4:25)

Register Name	***FIR Mask***
Mnemonic	TCM.FIR_MASK
Address	0000000003040002 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	FIR_MASK_IN0: mask for xfir summary bit
1	RW	FIR_MASK_IN1: mask for xfir PCB status bit
2	RW	FIR_MASK_IN2: mask for xfir IO status bit
3	RW	FIR_MASK_IN3: mask for LFIR status bit
4:26	RW	FIR_MASK_IN4: masks for XFIR and RFIR

Register Name	*Special Attention*
Mnemonic	TCM.EPS.FIR.SPATTN
Address	0000000003040004 (PCB) 0000000003040005 (PCB1) 0000000003040006 (PCB2)
Attributes	
Description	

Bits	PCB	PCB1	PCB2	Field Mnemonic: Description
0	ROX	NCX	NCX	SPATTN_IN0: MEM Chiplet Only: Special Attention from MBA01
1	ROX	NCX	NCX	SPATTN_IN1: MEM Chiplet Only: Special Attention from MBA23
2:9	ROX	NCX	NCX	SPATTN_IN2: unused special attentions

Register Name	*Special Attention Mask*
Mnemonic	TCM.EPS.FIR.SPA_MASK
Address	0000000003040007 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:9	RW	SPA_MASK_IN: special attention mask

Register Name	*Mode Register*
Mnemonic	TCM.EPS.FIR.MODE_REG
Address	0000000003040008 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	MODE_IN0: Enable Clockstop on Checkstop
1	RW	MODE_IN1: Enable Clockstop on Recoverable
2	RW	MODE_IN2: Enable Clockstop on Spattn
3	RW	MODE_IN3: Core-only Spattn
4	RW	MODE_IN4: Stop Chip TOD on Checkstop
5	RW	MODE_IN5: Stop Chip TOD on Recoverable

Bits	PCB	Field Mnemonic: Description
6	RW	MODE_IN6: Disable propagation of checkstop to other chips
7	RW	MODE_IN7: turns xstop on trig into clkstp on trig
8	RW	MODE_IN8: enable xstop on special attention
9	RW	MODE_IN9: mask_direct/local_error
10	RW	MODE_IN10: mask_xstop_to_pcb
11	RW	MODE_IN11: mask external xstop
12:15	RW	MODE_IN: unused

Register Name	***Local FIR***
Mnemonic	TCM.LOCAL_FIR
Address	000000000304000A (PCB) 000000000304000B (PCB1) 000000000304000C (PCB2)
Attributes	
Description	

Bits	PCB	PCB1	PCB2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	FIR_IN0: CFIR internal parity error
1	RWX	WOX_AND	WOX_OR	FIR_IN1: local errors from GPIO (PCB error)
2	RWX	WOX_AND	WOX_OR	FIR_IN2: local errors from CC (PCB error)
3	RWX	WOX_AND	WOX_OR	FIR_IN3: local errors from CC (OPCG, parity, scan collision, ...)
4	RWX	WOX_AND	WOX_OR	FIR_IN4: local errors from PSC (PCB error)
5	RWX	WOX_AND	WOX_OR	FIR_IN5: local errors from PSC (parity error)
6	RWX	WOX_AND	WOX_OR	FIR_IN6: local errors from Thermal (parity error)
7	RWX	WOX_AND	WOX_OR	FIR_IN7: local errors from Thermal (PCB error)
8	RWX	WOX_AND	WOX_OR	FIR_IN8: local errors from Thermal (critical Trip error)
9	RWX	WOX_AND	WOX_OR	FIR_IN9: local errors from Thermal (fatal Trip error)
10	RWX	WOX_AND	WOX_OR	FIR_IN10: local errors from Thermal (Voltage trip error)
11	RWX	WOX_AND	WOX_OR	FIR_IN11: local errors from mba01 Trace Array (error)
12	RWX	WOX_AND	WOX_OR	FIR_IN12: local errors from mba01 Trace Array (error)
13	RWX	WOX_AND	WOX_OR	FIR_IN13: local errors from mba23 Trace Array (error)
14	RWX	WOX_AND	WOX_OR	FIR_IN14: local errors from mba23 Trace Array (error)
15:39	RWX	WOX_AND	WOX_OR	FIR_IN15: unused local errors
40	RWX	WOX_AND	WOX_OR	FIR_IN40: malfunction alert (local xstop in another chiplet)

Register Name	***Local FIR Mask***
Mnemonic	TCM.EPS.FIR.LOCAL_FIR_MASK
Address	000000000304000D (PCB) 000000000304000E (PCB1) 000000000304000F (PCB2)
Attributes	
Description	

Bits	PCB	PCB1	PCB2	Field Mnemonic: Description
0:40	RW	WO_AND	WO_OR	LFIR_MASK_IN: mask for LEM error collection vector

Register Name	***Local FIR Action0***
Mnemonic	TCM.EPS.FIR.LOCAL_FIR_ACTION0
Address	0000000003040010 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:40	RW	FIR_ACTION0_IN: action0 mask

Register Name	***Local FIR Action1***
Mnemonic	TCM.EPS.FIR.LOCAL_FIR_ACTION1
Address	0000000003040011 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:40	RW	FIR_ACTION1_IN: action1 mask

Register Name	***DTS Thermal Sensor Results***
Mnemonic	TCM.EPS.THERM.DTS_RESULT0
Address	0000000003050000 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:15	ROX	DTS_0_RESULT: Calibrated DTS Result of sensor with id 0.
16:31	ROX	DTS_1_RESULT: Calibrated DTS Result of sensor with id 1.
32:63	RO	constant=0b00000000000000000000000000000000

Register Name	***DTS Trace Results***
Mnemonic	TCM.EPS.THERM.DTS_TRC_RESULT
Address	0000000003050003 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.

Bits	PCB	Field Mnemonic: Description
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Over flow error bit of the time stamp counter value during DTS trace mode.
45:47	RO	constant=0b000
48:63	ROX	DTS_0_RESULT: Calibrated DTS Result of sensor with id 0.

Register Name	***DTS0-1 Bit 0 - 15: Temperature Result DTS0, Bit 16 - 31: Temperature Result DTS1(available Only In NEST Chiplet),***
Mnemonic	TCM.EPS.THERM.ENC_CPM_RESULT0
Address	0000000003050008 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:15	ROX	DTS_0_RESULT: Calibrated DTS Result of sensor with id 0.
16:31	ROX	DTS_1_RESULT: Calibrated DTS Result of sensor with id 1.
32:55	RO	constant=0b00000000000000000000000

Register Name	***Voltage Sensor Results***
Mnemonic	TCM.EPS.THERM.VOLT_READ0
Address	000000000305000B (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:15	ROX	Reserved field (Access type is volt_data0)
16:31	ROX	Reserved field (Access type is volt_data1)
32:63	RO	constant=0b00000000000000000000000000000000

Register Name	***CPM & DTS Enables And Controls***
Mnemonic	TCM.EPS.THERM.THERM_MODE_REG
Address	000000000305000F (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	THERM_DIS_CPM_BUBBLE_CORR: critical path result bubble correction active
1	RW	THERM_FORCE_THRES_ACT: force tpc_therm_thres_mac clock gating off and activates clocks
2:4	RW	THERM_THRES_TRIP_ENA: therm_thres_trip compare enables 1xx: trip0 - warning x1x: trip1 - critical xx1: trip2 - fatal

Bits	PCB	Field Mnemonic: Description
5	RW	THERM_DTS_SAMPLE_ENA: 0: no dts sampling, 1: dts sampling is enabled and below counter compare match can occur.
6:9	RW	THERM_SAMPLE_PULSE_CNT: A 16 MHz sample pulse is feed into an 18 Bit counter, with the therm_sample_pulse_cnt it is possible to select a highorder bit of the counter to enable a resolutions of sampling dtss between 2.5 us and 80 ms. An edge detection circuit detects the rising edge of the selected counter bit and this triggers a dts sample 0000: 16 ms 0001: 8 ms 0010: 4 ms 0011: 2 ms 0100: 1 ms 0101: 0.5 ms 0110: 250 us 0111: 125 us 1000: 62 .5us 1001: 31.3 us 1010: 15.6 us 1011: 7.8 us 1100: 3.9 us 1101: 2 us 1110: 1 us 1111: 0.5 us
10:11	RW	THERM_THRES_MODE_ENA: forces max or min mode in threshold unit: 00: is off 11: is illegal 10: max mode 01: min mode
12	RW	DTS_TRIGGER_MODE: unused
13	RW	DTS_TRIGGER_SEL: unused
14:15	RW	THERM_MODE_UNUSED: unused
16:19	RW	THERM_DTS_READ_SEL: selects which dts result will be provided with pcb read addr_v(4): 000: DTS 0 001: DTS 1 010: DTS 2 011: DTS 3 100: DTS 4 111: Worst Case Sensor
20:21	RW	THERM_DTS_ENABLE: dts enables: 1xxxx: DTS 0 available x1xx: DTS 1 available
22:34	RO	constant=0b0000000000000
35:36	RW	THERM_CPM_ENABLE: com enables

Register Name	***Skitter Control Register***
Mnemonic	TCM.EPS.THERM.SKITTER_MODE_REG
Address	0000000003050010 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	SKITTER_HOLD_SAMPLE: forces skitter to hold current sample
1	RW	DISABLE_SKITTER_STICKINESS: if '0' accumulation mode, '1' samples new value each cycle and resets sticky value
2:3	RW	SKITTER_MODE_UNUSED1: unused

Bits	PCB	Field Mnemonic: Description
4:5	RW	SKITTER_HOLD_DBGTRIG_SEL: bit0: hold_on_trigger0 bit1: _on_trigger1
6:7	RW	SKITTER_RESET_TRIG_SEL: bit0: reset_sticky_on_trigger0 bit1: reset_sticky_on_trigger1
8:9	RW	SKITTER_SAMPLE_GUTS: selects guts to measure: 00: guts1 01: guts2 10: guts3 11: guts4
10:43	RO	constant=0b00000000000000000000000000000000
44	ROX	SKITTER_HOLD_SAMPLE_WITH_TRIGGER: forces skitter to hold current sample on dbg trigger, this has highest priority
45	ROX	SKITTER_DATA_V_LT: if '1' the data requested by a skitter force read register has finished and data is present in skitter data register in the collector macro. The data be read by any combination of V25/V26/V27 pcb reads

Register Name	***Error Injection Control Register***
Mnemonic	TCM.EPS.THERM.INJECT_REG
Address	0000000003050011 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:1	RW	THERM_INJECT_TRIP: 00: no injection 01: warning trip level injection 10: critical trip level injection 11: fatal trip level injection
2:3	RW	THERM_INJECT_MODE: 00: no injection 01: injection on the next dts sample 10: solid injection for the next dts samples till bit setting changes 11: not used

Register Name	***Control / Force Reset Register***
Mnemonic	TCM.EPS.THERM.CONTROL_REG
Address	0000000003050012 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	WO_1P	Reserved field (Access type is reset_trip_history)
1	WO_1P	Reserved field (Access type is reset_sample_pulse_cnt)
2	WO_1P	Reserved field (Access type is f_reset_cpm_rd)
3	WO_1P	Reserved field (Access type is f_reset_cpm_wr)
4	WO_1P	Reserved field (Access type is reset_sample_dts)
5	WO_1P	Reserved field (Access type is force_sample_dts)
6	WO_1P	Reserved field (Access type is force_sample_dts_interruptible)

Bits	PCB	Field Mnemonic: Description
7	WO_1P	Reserved field (Access type is force_reset_thres_l1results)
8	WO_1P	Reserved field (Access type is force_reset_thres_l2results)
9	WO_1P	Reserved field (Access type is force_reset_thres_l3results)
10	WO_1P	Reserved field (Access type is force_measure_volt_interruptible)
11	WO_1P	Reserved field (Access type is force_reset_measure_volt)
12	WO_1P	Reserved field (Access type is force_shift_sensor)

Register Name	***Thermal Error Status Register***
Mnemonic	TCM.EPS.THERM.ERR_STATUS_REG
Address	0000000003050013 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	Reserved field (Access type is serial_shiftcnt_modereg_parity_err_hold)
1	ROX	Reserved field (Access type is therm_modereg_parity_err_hold)
2	ROX	Reserved field (Access type is skitter_modereg_parity_err_hold)
3	ROX	Reserved field (Access type is skitter_forcereg_parity_err_hold)
4	ROX	Reserved field (Access type is scan_init_version_reg_parity_err_hold)
5	ROX	Reserved field (Access type is volt_modereg_parity_err_hold)
6	ROX	Reserved field (Access type is skitter_clksrcreg_parity_err_hold)
7	ROX	Reserved field (Access type is count_state_err_hold)
8	ROX	Reserved field (Access type is run_state_err_hold)
9	ROX	Reserved field (Access type is thres_therm_state_err_hold)
10	ROX	Reserved field (Access type is thres_therm_overflow_err_hold)
11	ROX	Reserved field (Access type is shifter_parity_err_hold)
12	ROX	Reserved field (Access type is shifter_valid_err_hold)
13	ROX	Reserved field (Access type is timeout_err_hold)
14	ROX	Reserved field (Access type is f_skitter_err_hold)
15	ROX	Reserved field (Access type is pcb_err_hold_out)
16	ROX	SERIAL_SHIFTCNT_MODEREG_PARITY_ERR_MASK: serial shift count parity error mask
17	ROX	THERM_MODEREG_PARITY_ERR_MASK: therm mode reg parity error mask
18	ROX	SKITTER_MODEREG_PARITY_ERR_MASK: skitter mode register parity error mask
19	ROX	SKITTER_FORCEREG_PARITY_ERR_MASK: skitter force register parity error mask
20	ROX	SCAN_INIT_VERSION_REG_PARITY_ERR_MASK: scan init version register parity error mask
21	ROX	VOLT_MODEREG_PARITY_ERR_MASK: volt mode reg parity error mask
22	RO	constant=0b0
23	ROX	COUNT_STATE_ERR_MASK: count state machine error mask
24	ROX	RUN_STATE_ERR_MASK: run state machine error mask
25	ROX	THRES_STATE_ERR_MASK: thres state machine error mask
26	ROX	OVERFLOW_ERR_MASK: DTS calibration calculation overflow error mask

Bits	PCB	Field Mnemonic: Description
27	ROX	SHIFTER_PARITY_ERR_MASK: Shifter parity error mask
28	ROX	SHIFTER_VALID_ERR_MASK: Shifter valid error mask
29	ROX	TIMEOUT_ERR_MASK: Timeout error mask
30	ROX	F_SKITTER_READ_ERR_MASK: force skitter read one hot error mask
31	ROX	PCB_ERR_MASK: pervasive control bus error mask
32:39	RO	constant=0b00000000
40:43	ROX	Reserved field (Access type is count_state_lt)
44:46	ROX	Reserved field (Access type is run_state_lt)
47	ROX	Reserved field (Access type is shift_dts_lt)
48	ROX	Reserved field (Access type is shift_volt_lt)
49:50	ROX	Reserved field (Access type is read_state_lt)
51:54	ROX	Reserved field (Access type is write_state_lt)
55	ROX	Reserved field (Access type is sample_dts_lt)
56	ROX	Reserved field (Access type is measure_volt_lt)
57	ROX	Reserved field (Access type is read_cpm_lt)
58	ROX	Reserved field (Access type is write_cpm_lt)
59	ROX	Reserved field (Access type is unused)
60:63	RO	constant=0b0000

Register Name	***Skitter Force Read Register***
Mnemonic	TCM.EPS.THERM.SKITTER_FORCE_REG
Address	0000000003050014 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	F_SKITTER_READ: Forces the read of that particular skitter

Register Name	***Voltage Sensor Enables And Controls***
Mnemonic	TCM.EPS.THERM.VOLT_MODE_REG
Address	0000000003050015 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	VOLT_MEASURE_ENA: enables the measurement of voltage sensor
1	RW	VOLT_TRIP_ENA: enables the trip of voltage sensor
2:3	RW	VOLT_ENABLE: Voltage sensor enables 1xxxx:voltage sensor0 available

Register Name	***Skitter Clock Src Control Register***
Mnemonic	TCM.EPS.THERM.SKITTER_CLKSRC_REG
Address	0000000003050016 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:2	RW	SKITTER0_CLKSRC: selects clock to measure: 000: local mesh clock 001: external pin skitter_c1_1_in 010: local d1clk only if d_mode = 1 011: external pin skitter_c1_2_in 100: local lclk only if d_mode = 1 101: external pin skitter_c1_3_in 110: unused 111: external pin skitter_c1_4_in
3:35	RO	constant=0b00000000000000000000000000000000

Register Name	***Skitter Data Register Read Bit0:63***
Mnemonic	TCM.EPS.THERM.SKITTER_DATA0
Address	0000000003050019 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:63	ROX	

Register Name	***Skitter Data Register Read Bit32:95***
Mnemonic	TCM.EPS.THERM.SKITTER_DATA1
Address	000000000305001A (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:63	ROX	

Register Name	***Skitter Data Register Read Bit64:127***
Mnemonic	TCM.EPS.THERM.SKITTER_DATA2
Address	000000000305001B (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:63	ROX	

Register Name	***Timestamp Counter Read***
Mnemonic	TCM.EPS.THERM.TIMESTAMP_COUNTER_READ
Address	000000000305001C (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:43	ROX	TIMESTAMP_COUNTER_VALUE: Time stamp counter value during DTS trace mode.
44	ROX	TIMESTAMP_COUNTER_OVERFLOW_ERR: Over flow error bit of the time stamp counter value during DTS trace mode.

Register Name	***Contains The Slave's Primary Address***
Mnemonic	TPTOP.NET.PCBSLMEM.PRIMARY_ADDRESS_REG
Address	00000000030F0000 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RO	Reserved field (Access type is primary_address)

Register Name	***Multicast Group 1***
Mnemonic	TPTOP.NET.PCBSLMEM.MULTICAST_GROUP_1
Address	00000000030F0001 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:2	RO	constant=0b111
3:5	RW	MULTICAST1_GROUP: multicast group1 setting

Register Name	***Multicast Group 2***
Mnemonic	TPTOP.NET.PCBSLMEM.MULTICAST_GROUP_2
Address	00000000030F0002 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:2	RO	constant=0b111
3:5	RW	MULTICAST2_GROUP: multicast group2 setting

Register Name	***Multicast Group 3***
Mnemonic	TPTOP.NET.PCBSLMEM.MULTICAST_GROUP_3
Address	00000000030F0003 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:2	RO	constant=0b111
3:5	RW	MULTICAST3_GROUP: multicast group3 setting

Register Name	***Multicast Group 4***
Mnemonic	TPTOP.NET.PCBSLMEM.MULTICAST_GROUP_4
Address	00000000030F0004 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:2	RO	constant=0b111
3:5	RW	MULTICAST4_GROUP: multicast group4 setting

Register Name	***Timeout Select Register***
Mnemonic	TPTOP.NET.PCBSLMEM.TIMEOUT_REG
Address	00000000030F0010 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:1	RW	Reserved field (Access type is int_timeout)

Register Name	***Assist Interrupt Register***
Mnemonic	TPTOP.NET.PCBSLMEM.ASSIST_INTERRUPT_REG
Address	00000000030F0011 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	Reserved field (Access type is attn)
1	ROX	Reserved field (Access type is recov)
2	ROX	Reserved field (Access type is xstop)

Register Name	*GP3 Register (NA In PERV CPLT)*
Mnemonic	TPTOP.NET.PCBSLMEM.GP3_REG
Address	00000000030F0012 (PCB) 00000000030F0013 (PCB1) 00000000030F0014 (PCB2)
Attributes	
Description	

Bits	PCB	PCB1	PCB2	Field Mnemonic: Description
0	RWX	RWX_WAND	RWX_WOR	CHIPLET_ENABLE: Set if chiplet is good
1	RWX	RWX_WAND	RWX_WOR	PCB_EP_RESET: Output ORed to the global EP reset
2:4	RWX	RWX_WAND	RWX_WOR	Reserved field (Access type is pcb_access)
5	RWX	RWX_WAND	RWX_WOR	NCLK_NODIV: Force cache_nclk to equal nclk (for test only).
6	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN: Scan control for chiplet vital domain.
7	RWX	RWX_WAND	RWX_WOR	VITAL_SCAN_IN: Scan in for the chiplet vital domain.
8:10	RWX	RWX_WAND	RWX_WOR	Reserved field (Access type is pcb_access)
11	RWX	RWX_WAND	RWX_WOR	D_MODE: LCB control signal for vital logic.
12	RWX	RWX_WAND	RWX_WOR	ACT_DIS: LCB control signal for vital logic.
13	RWX	RWX_WAND	RWX_WOR	MPW2: LCB control signal for vital logic.
14	RWX	RWX_WAND	RWX_WOR	MPW1: LCB control signal for vital logic.
15	RWX	RWX_WAND	RWX_WOR	DELAY_LCLKR: LCB control signal for vital logic.
16	RWX	RWX_WAND	RWX_WOR	VITAL_THOLD: Thold for the chiplet vital domain.
17	RWX	RWX_WAND	RWX_WOR	FENCE2_EN: Fencing signal for chiplet.
18	RWX	RWX_WAND	RWX_WOR	FENCE_EN: Fencing signal for chiplet.
19:21	RWX	RWX_WAND	RWX_WOR	Reserved field (Access type is pm_access)
22	RWX	RWX_WAND	RWX_WOR	RESCLK_FLUSH: Flush for resonant clocking.
23	RWX	RWX_WAND	RWX_WOR	RESCLK_OVERRIDE_VALUE: Override value for resonant clocking.
24	RWX	RWX_WAND	RWX_WOR	DPHY_PLL: dphy pll
25	RWX	RWX_WAND	RWX_WOR	Reserved field (Access type is pm_access)
26	RWX	RWX_WAND	RWX_WOR	TP_FENCE_PCB: Fence the Chiplet from the PCB Bus. If set, PCB Slave will report 'Chiplet Offline'.
27	RWX	RWX_WAND	RWX_WOR	FSYNC_ENABLE: Set the 'Frame Synchronous (Geared) Clocking Mode' .
28	RWX	RWX_WAND	RWX_WOR	L3_EDRAM_ENABLE: L3 eDRAM enable. Forced low during EP reset.
29	RWX	RWX_WAND	RWX_WOR	Reserved field (Access type is pm_access)
30	RWX	RWX_WAND	RWX_WOR	CHIPET_RI: Chiplet RI
31	RWX	RWX_WAND	RWX_WOR	CHIPET_DI1: Chiplet DI1

Register Name	*Skew Adjust Data*
Mnemonic	TPTOP.NET.PCBSLMEM.CLK_ADJ_REG
Address	00000000030F0015 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:15	ROX	

Register Name	*Clock Adjust Config*
Mnemonic	TPTOP.NET.PCBSLMEM.CLK_ADJ_SET
Address	00000000030F0016 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:31	RW	CLK_ADJ_SET_REG: Clk adj config

Register Name	*Vital Scan Out*
Mnemonic	TPTOP.NET.PCBSLMEM.VITAL_SCAN_OUT
Address	00000000030F0017 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	

Register Name	*Chiplet Heartbeat Register*
Mnemonic	TPTOP.NET.PCBSLMEM.HEARTBEAT_REG
Address	00000000030F0018 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	HEARTBEAT_DEAD: Chiplet heartbeat not detected

Register Name	*Lock Indications From PLLs*
Mnemonic	TPTOP.NET.PCBSLMEM.PLL_LOCK_REG
Address	00000000030F0019 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:3	ROX	Reserved field (Access type is lock)

Register Name	***Attn Interrupt***
Mnemonic	TPTOP.NET.PCBSLMEM.ATTN_INTERRUPT_REG
Address	00000000030F001A (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	Reserved field (Access type is attn)

Register Name	***Recov Interrupt***
Mnemonic	TPTOP.NET.PCBSLMEM.RECOV_INTERRUPT_REG
Address	00000000030F001B (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	Reserved field (Access type is recov)

Register Name	***Xstop Interrupt***
Mnemonic	TPTOP.NET.PCBSLMEM.XSTOP_INTERRUPT_REG
Address	00000000030F001C (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	Reserved field (Access type is xstop)

Register Name	***Slave Config Register***
Mnemonic	TPTOP.NET.PCBSLMEM.SLAVE_CONFIG_REG
Address	00000000030F001E (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	CFG_DISABLE_PERV_THOLD_CHECK: Disable pervasive thold check
1	RW	CFG_DISABLE_MALF_PULSE_GEN: Disable pulse generation for malf alert. Switch back to level
2	RW	CFG_STOP_HANG_CNT_SYS_XSTP: Disable hang counter stop for system xstop
3	RW	CFG_DISABLE_CL_ATOMIC_LOCK: Disable atomic lock for chiplet accesses
4	RW	CFG_DISABLE_HEARTBEAT: Disable check for voltage and gridclock in the chiplet
5:7	RW	
8:12	RW	ERROR_MASK: mask bits for slave error reporting

Bits	PCB	Field Mnemonic: Description
13:15	RW	

Register Name	*Error Capture Register*
Mnemonic	TPTOP.NET.PCBSLMEM.ERROR_REG
Address	00000000030F001F (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RWX_WCLEAR	CE_ERROR: Correctable error on pcb bus
1:3	RWX_WCLEAR	CHIPLET_ERRORS: Errors reported by chiplet 000 = no error 001 = XSCOM command blocked due pending errors 010 chiplet offline 011 partial good 100 invalid address / address error / bad access type 101 clock error 110 parity error / received unexpected packet / wrong packet number 111 timeout This register is for debug purposes only. It only holds meaningful data if it is cleared after each error.
4	RWX_WCLEAR	PARITY_ERROR: Parity error on PCB Interface
5	RWX_WCLEAR	DATA_BUFFER_ERROR: Parity error in data buffer
6	RWX_WCLEAR	ADDR_BUFFER_ERROR: Parity error in address buffer
7	RWX_WCLEAR	PCB_FSM_ERROR: Invalid state error in PCB FSM
8	RWX_WCLEAR	CL_FSM_ERROR: Invalid state error in Chiplet FSM
9	RWX_WCLEAR	INT_RX_FSM_ERROR: Invalid state error in interrupt RX FSM
10	RWX_WCLEAR	INT_TX_FSM_ERROR: Invalid state error in interrupt TX FSM
11	RWX_WCLEAR	INT_TYPE_ERROR: Invalid interrupt type
12	RWX_WCLEAR	CL_DATA_ERROR: Parity error on Chiplet Interface
13	RWX_WCLEAR	INFO_ERROR: Parity error on Chiplet info lines
14	RWX_WCLEAR	UNUSED_0:
15	RWX_WCLEAR	CHIPLET_ATOMIC_LOCK_ERROR: Chiplet atomic lock error
16	RWX_WCLEAR	PCB_INTERFACE_ERROR: Error of pcb interface component for the internal endpoint
17	RWX_WCLEAR	CHIPLET_OFFLINE: Heartbeat check indicated that chiplet is offline
18	RWX_WCLEAR	CHIPLET_GRID_SKITTER: Heartbeat check indicated skitter on the chiplet grid
19	RWX_WCLEAR	GP3_REG_PARITY_ERROR: gp3 register parity bad
20	RWX_WCLEAR	ADDRESS_REG_PARITY_ERROR: address register parity bad

Bits	PCB	Field Mnemonic: Description
21	RWX_WCLEAR	TIMEOUT_REG_PARITY_ERROR: timeout select register parity bad
22	RWX_WCLEAR	CONFIG_REG_PARITY_ERROR: slave config register parity bad
23	RWX_WCLEAR	CLK_ADJ_REG_PARITY_ERROR: clk adj register parity bad
24	RWX_WCLEAR	DIV_REG_PARITY_ERROR: div register parity bad
25:28	RWX_WCLEAR	PLL_UNLOCK_ERROR: unlock from chiplet pll

Register Name	***Hang Pulse Generation Register 0***
Mnemonic	TPTOP.NET.PCBSLMEM.HANG_PULSE_0_REG
Address	00000000030F0020 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_0: Value of hang pulse 0. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_0: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	***Hang Pulse Generation Register 1***
Mnemonic	TPTOP.NET.PCBSLMEM.HANG_PULSE_1_REG
Address	00000000030F0021 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_1: Value of hang pulse 1. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_1: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	***Hang Pulse Generation Register 2***
Mnemonic	TPTOP.NET.PCBSLMEM.HANG_PULSE_2_REG
Address	00000000030F0022 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_2: Value of hang pulse 2. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_2: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	*Hang Pulse Generation Register 3*
Mnemonic	TPTOP.NET.PCBSLMEM.HANG_PULSE_3_REG
Address	00000000030F0023 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_3: Value of hang pulse 3. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_3: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	*Hang Pulse Generation Register 4*
Mnemonic	TPTOP.NET.PCBSLMEM.HANG_PULSE_4_REG
Address	00000000030F0024 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_4: Value of hang pulse 4. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_4: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	*Hang Pulse Generation Register 5*
Mnemonic	TPTOP.NET.PCBSLMEM.HANG_PULSE_5_REG
Address	00000000030F0025 (PCB)
Attributes	
Description	This hang counter is exclusively used to generate the malfunction alert pulse

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_5: Value of hang pulse 5. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_5: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	*Hang Pulse Generation Register 6*
Mnemonic	TPTOP.NET.PCBSLMEM.HANG_PULSE_6_REG
Address	00000000030F0026 (PCB)
Attributes	
Description	This hang counter is exclusively used for the heartbeat generation

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_6: Value of hang pulse 6. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_6: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	***Divider For Hang Counter Clock***
Mnemonic	TPTOP.NET.PCBSLMEM.PRE_COUNTER_REG
Address	00000000030F0028 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:7	RW	PRE_COUNTER: Divider for hang counter clock. Divides clock by n+1 (default: n=0)

Register Name	***Protect Mode Register***
Mnemonic	TPTOP.NET.PCBSLMEM.PROTECT_MODE_REG
Address	00000000030F03FE (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	READ_PROTECT_ENABLE: Enable read protection
1	RW	WRITE_PROTECT_ENABLE: Enable write protection

Register Name	***Atomic Lock Register***
Mnemonic	TPTOP.NET.PCBSLMEM.ATOMIC_LOCK_REG
Address	00000000030F03FF (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	ATOMIC_LOCK_ENABLE: Enable atomic lock
1:4	ROX	ATOMIC_ID: Atomic ID

6. PCB Slave 3: DPHY01 Indirect Registers

The memory buffer registers are listed alphabetically by mnemonic in the following address table.

The memory buffer registers are listed in the following tables.

Register Name	***DP18 Data Bit Enable 0***
Mnemonic	DPHY01.DDRPHY_DP18_DATA_BIT_ENABLE0_P0_0
Address	800000000301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:63	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE0_P0_DP18_0_DATA_BIT_ENABLE_0_15: '1'b Indicates the DP18 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. '0'b Indicates the DP18 bit is not used to send or receive data. Bit 0 controls MEMINTD00B(n) Bit 1 controls MEMINTD01B(n) Bit 2 controls MEMINTD02B(n) ... Bit 15 controls MEMINTD15B(n) where n is the DP18 Instance Number.

Register Name	***DP18 Data Bit Enable 1***
Mnemonic	DPHY01.DDRPHY_DP18_DATA_BIT_ENABLE1_P0_0
Address	800000010301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:55	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_DATA_BIT_ENABLE_16_23: '1'b Indicates the DP18 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. '0'b Indicates the DP18 bit is not used to send/receive data. Bit 0 controls MEMINTD16B(n) Bit 1 controls MEMINTD17B(n) Bit 2 controls MEMINTD18B(n) ... Bit 7 controls MEMINTD23B(n) where n is the DP18 Instance Number. If DATA_BIT_ENABLE16 or if DATA_BIT_ENABLE17 is '1'b, none of the QUAD*_CLK16 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE18 or if DATA_BIT_ENABLE19 is '1'b, none of the QUAD*_CLK18 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE20 or if DATA_BIT_ENABLE21 is '1'b, none of the QUAD*_CLK20 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE22 or if DATA_BIT_ENABLE23 is '1'b, none of the QUAD*_CLK22 bits can be '1'b in the registers defined in and can be '1'b This field must remain at the reset value.
56	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_DFT_FORCE_OUTPUTS: '1'b - The 24 outputs of the DP18 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is '1'b and forced to a high-imp eden ce state when the corresponding DATA_BIT_ENABLE bit is '0'b. When a DP18 output is forced to a low-z state, the value driven out, '1'b or '0'b, is determined by the corresponding DATA_BIT_DIR bit value in the registers. '0'b - The 24 outputs of the DP18 are not forced.
57	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_DFT_PRBS7_GEN_EN: '1'b - The 24 outputs of the DP18 are forced to a low-z state when the corresponding DATA_BIT_ENABLE bit is '1'b or when enabled as a write clock in the register defined in. An output is forced to a high-z state when the corresponding DATA_BIT_ENABLE bit is '0'b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: when a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in phase, synchronous clocks, edge aligned clocks, and are not differential. '0'b - The 24 outputs of the DP18 are not forced.
58	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be '0'b for proper functional operation.
59	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_HW_VALUE:
60	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_MRS_CMD_DATA_N0: This is the value that is driven by memint_d00_b - memint_d03_b, memint_d16_b, and memint_d17_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
61	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_MRS_CMD_DATA_N1: This is the value that is driven by memint_d04_b - memint_d07_b, memint_d18_b, and memint_d19_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
62	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_MRS_CMD_DATA_N2: This is the value that is driven by memint_d08_b - memint_d11_b, memint_d20_b, and memint_d21_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
63	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_0_MRS_CMD_DATA_N3: This is the value that is driven by memint_d12_b - memint_d15_b, memint_d22_b, and memint_d23_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.

Register Name	***DP18 Data Bit Direction 0***

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:63	RW	DDRPHY_DP18_01_DATA_BIT_DIR0_P0_DP18_0_DATA_BIT_DIR_0_15: '1'b Indicates the DP18 bit is an output and continuously drives out a signal. A given bit must only be set when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. For protocols with bidirectional data buses, '0'b indicates that the DP18 bit is bidirectional and is used to send data to the memory device and to receive data from the memory device when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. For protocols with unidirectional data buses, '0'b indicates the DP18 bit in an input and is used for receiving data from the memory device when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. Bit 0 controls MEMINTD00B(n) Bit 1 controls MEMINTD01B(n) Bit 2 controls MEMINTD02B(n) ... Bit 15 controls MEMINTD15B(n) where n is the DP18 Instance Number. This field must remain at the reset value.

Register Name	***DP18 Data Bit Direction 1***

55	RW	
56:59	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_0_SXMCVREF_0_3: VREF Trim control signals. This field is connected directly to the S0MCVREF{0:3} and S1MCVREF{0:3} input pins on the analog core.
60	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_0_SXPODVREF: Receiver VREF Pseudo-Open Drain mode. '0'b - 0.5*DVDD '1'b - POD mode (0.7*DVDD) This field is connected directly to the S0PODVREF and S1PODVREF inputs on the analog core.
61	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_0_DISABLE_TERMINATION: '0'b - Data and Strobe pins termination resistors are turned on during read data transfer. '1'b - Data and Strobe pins termination resistors are always off.
62:63	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_0_READ_CENTERING_MODE: '00'b - Data read from memory is compared to the value of bits 0:7 of register 0 of the registers . '01'b - Reserved. Do not execute Custom Read Centering with this value. '10'b - Reserved. Do not execute Custom Read Centering with this value. '11'b - Data read from memory is compared to the value of the registers , staggered across DQ lanes as specified by the registers, and and rotated through the four bytes of the registers every 8 beats. Use this setting for staggered, serial, and parallel modes. The values in the registers determine whether staggered or serial mode is being used. Parallel mode is supported with firmware assist, but should not be used for calibration. These bits are not used if Custom read Centering is not enabled. these bits are not used during Periodic Read Centering. The expected read data is always an alternating 01010101 pattern during Periodic Read Centering. For all protocols except DDR3 and DDR4, Custom Read Centering must not be enabled. the value of the reserved location in DDR3 and DDR4 devices, and the value of the MPR registers in DDR4 memories, is written during Initial Pattern Write. See the CUSTOM_INIT_WRITE field. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR3 and DDR4 devices and is read from the reserved location of RLDRAM devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the register.

Register Name	***DP18 SysClk Phase Rotator Control***
Mnemonic	DPHY01.DDRPHY_DP18_SYSCLK_PR_P0_0
Address	800000070301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_0_SYSCLK_ENABLE: Enables the SysClk and SysClkQ phase rotators. (SYSCLKPDOWN and SYSZCLKPDOWN input on NEOANA18)
49:55	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_0_SYSCLK_ROT_OVERRIDE: This field has a dual purpose: Override Control, and Lock Control. When SYSCLK_ROT_OVERRIDE_EN = '1'b, this field is in Override Control mode. When SYSCLK_ROT_OVERRIDE_EN = '0'b, this field is in Lock Control. For Override Control: System Clock (SysClk) Phase Rotator Override Value. (binary_offset_i[0:6] inputs of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field is 'reserved'. For Lock Control: Write this field to all zeros unless instructed otherwise by your IBM representative. bit 2: Lock Select: Selects between lock status and sticky lock. '0'b - Selects the status of the lock. When the dphy_nclk detect has reached alignment between the dphy_nclk and SysClk, the BB_LOCK field is asserted. '1'b - Selects the sticky lock to the BB_LOCK field . The sticky lock is controlled by bit 4, sticky lock enable. Once the sticky lock is set, it remains set. bit 4: Sticky Lock Enable bit 5:7: '000'b - At most 1 count increment or decrement occurs to indicate lock. '001'b - At most 2 counts increment or decrement occur to indicate lock. '010'b - At most 3 counts increment or decrement occur to indicate lock. '011'b - At most 4 counts increment or decrement occur to indicate lock. '100'b - At most 5 counts increment or decrement occur to indicate lock.
56	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_0_SYSCLK_ROT_OVERRIDE_EN: Enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to '1'b. (binary_offset_override_i input of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provides the required separation. When this bit is written to '0'b and was '1'b, the SYSCLK_ROT value in the register resets to zero.
57	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_0_SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_nclk - SysClk Phase Alignment Controller (reset_all_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted after PLL locks, active for at least 5 SysClk Cycles
58	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_0_SYSCLK_PHASE_CNTL_EN: Alignment Enable to dphy_nclk - SysClk Phase Alignment Controller (pr_cntl_enable_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_0_SYSCLK_PHASE_DEFAULT_EN: Enables default start up values to be output by the dphy_nclk - SysClk Phase Alignment Controller. (xsel_w_fence_i input to the dphy_nclk to SysClk alignment circuit) Should be asserted during system reset and deasserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_0_SYSCLK_POS_EDGE_ALIGN: Edge alignment strap to dphy_nclk - SysClk Phase Alignment Controller (pos_edge_alignment_i input to the dphy_nclk to SysClk alignment circuit) '1'b - Positive edge alignment of SysClk to positive edge of dphy_nclk '0'b - Negative edge alignment of SysClk to positive edge of dphy_nclk
61	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_0_CONTINUOUS_UPDATE: '1'b - The dphy_nclk - SysClk Phase Alignment Controller runs continuously and thus continuously align the dphy_nclk clock to the internal SysClk clock. '0'b - The dphy_nclk - SysClk Phase Alignment Controller only updates periodically under hardware control when an update does not interfere with the PHY functional operations. (continuous_update_i input of the dphy_nclk to SysClk alignment circuit)
62:63	RO	constant=0b00

Register Name	***DP18 DFT Digital Eye***
Mnemonic	DPHY01.DDRPHY_DP18_DFT_DIG_EYE_P0_0
Address	800000080301143F (SCOM)
Attributes	
Description

51	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_INCOMPLETE_RD_CAL_N0: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
52	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_INCOMPLETE_RD_CAL_N1: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.
53	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_INCOMPLETE_RD_CAL_N2: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
54	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_INCOMPLETE_RD_CAL_N3: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
55	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_COARSE_PATTERN_ERR_N0: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
56	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_COARSE_PATTERN_ERR_N1: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.
57	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_COARSE_PATTERN_ERR_N2: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
58	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_COARSE_PATTERN_ERR_N3: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
59	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_EYE_CLIPPING: Read Centering ErrorStatus. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, set the EYE_CLIPPLING_MASK bit be set to '1'b so that this condition is not reported as an error. When EYE_CLIPPING_MAKS is '1'b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases with the margin for inter-symbol interference and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_NO_DQS: DQS Alignment ErrorStatus. Set when a strobe edge was not detected during DQS Alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 12 UI rank-to-rank compression rule.
61	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_NO_LOCK: DQS Alignment Error and Status. Set when a phase rotator lock could not be attained on a strobe during DQS Alignment calibration. The No Lock error detect circuit detects a DQS strobe which is always '1'b or always '0'b. When a DQS strobe is always '1'b or '0'b it is considered missing or stuck. The No Lock circuit sets this bit when: a) never have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK)andb) the strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK) If a strobe is stuck or broken, its location cannot be determined and thus it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI and thus an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuckbroken strobes in a way that maintains the 12 UI rank-to-rank compression rule.

Bits	SCOM	Field Mnemonic: Description
62	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_DRIFT_ERROR: Periodic Read Calibration ErrorStatus: Set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the register . The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank to rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of ECC code as the final arbiter.
63	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_0_MIN_EYE: Periodic Read Calibration ErrorStatus: Set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the register . The minimum eye size can be configured to a value that would be informational or it could be configured to a limit that reflects a customers maximum tolerance for errors in which case it could be considered to be an error.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:52	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P0_DP18_0_BIT_CENTERED: When the DONE bit is set, this field contains the bit number (0 to 23) on which the Write Centering algorithm has been applied.
53	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P0_DP18_0_SMALL_STEP_LEFT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the right to find the 1st valid data sample. When this bit is set, the Write Centering algorithm will begin to small step to the left to find the left edge of the eye, the 1st invalid data sample. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
54	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P0_DP18_0_BIG_STEP_RIGHT: This bit is set when invalid data is sampled when the Write Centering algorithm is small stepping to the left and finds the left edge of the eye. When this bit is set, the Write Centering algorithm will begin to big step to the right to find valid data again. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).

Bits	SCOM	Field Mnemonic: Description
55	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P0_DP18_0_MATCH_STEP_RIGHT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the right after finding the left edge of the eye. When this bit is set, the Write Centering algorithm will continue to big step to the right to find the right edge of the eye. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
56	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P0_DP18_0_JUMP_BACK_RIGHT: This bit is set when invalid data is sampled when the Write Centering algorithm is big stepping to the right to find the right side of the eye. When this bit is set, the Write Centering algorithm will big step to the left to find valid data. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
57	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P0_DP18_0_SMALL_STEP_RIGHT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the left to find valid data. When this bit is set, the Write Centering algorithm will small step to the right to find the right side of the eye, the 1st invalid data sample. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
58	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P0_DP18_0_DONE: This bit is set when invalid data is sampled when the Write Centering algorithm is small stepping to the right to find the right side of the eye. When the Write Centering algorithm completes successfully, this bit is set and the average of the left side and right side delay values is loaded into the register defined in which corresponds to the bit being write centered. When the Write Centering algorithm finds an error, this bit is set and the current delay value being used by the algorithm is loaded into the register defined in. The bit number being write centered loaded into the BIT_CENTERED field when this bit is set. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).

49:55	RW	DDRPHY_DP18_01_DQSCLK_OFFSET_P0_DP18_0_DQS_OFFSET: Prevents switching to the live DQS too early in RLDRAM or DDR4 modes, or during calibration routines of all protocols. Set this field to: DQS_OFFSET = 10 + ceiling(peak_to_peak_jitter_magnitude_in_ticks 2) or more specifically: DQS_OFFSET= 2 + ceiling(peak_to_peak_jitter_magnitude_in_ticks 2) + (peak_to_peak_periodic_drift_in_ticks2)Where peak_to_peak_jitter_magnitude_in_ticks is a whole number equal to the read clock strobe (DQS) peak to peak jitter rounded up to the nearest 128th memory clock. And, peak_to_peak_periodic_drift_in_ticks is the peak to peak drift of the read clock strobe (DQS) rounded up to the nearest 128th memory clock. The + 2 term in the equation accounts for the jitter sources within the DDR PHY.

The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_01_READ_EYE_SIZE3_RANK_PAIR0_P0_DP18_0_RD_EYE_SIZE1: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field , determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P0_DP18_0_DESIRED_EDGE_CNTR_TARGET_HIGH: Allows firmware control over the maximum edges required before the Initial DQS Alignment algorithm stays locked into Tracking mode. A larger count value makes the algorithm work harder before declaring that a phase lock between DRAM DQS and internal DQSCLK has occurred. This count value must always be greater than the DESIRED_EDGE_CNTR_TARGET_LOW value. Use the DESIRED_EDGE_CNTR_TARGET_HIGH value 12 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.
56:63	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P0_DP18_0_DESIRED_EDGE_CNTR_TARGET_LOW: Allows firmware control over the minimum edges required before the Initial DQS Alignment algorithm toggles between Coarse Search and Tracking mode. A larger count value makes it simpler for the algorithm return to Coarse Search mode, and harder to enter Tracking mode. This count value must always be smaller than the DESIRED_EDGE_CNTR_TARGET_HIGH value and greater than zero. Use the DESIRED_EDGE_CNTR_TARGET_LOW value 8 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.

Address	800000750301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P0_DP18_0_INTERP_SIG_SLEW: Interpolated Signal Slew Control Bits 0:3 are connected to inputs SxPRSTGH{0-3} and SYSPRSTGH{0-3} on the analog core. This field provides slew rate control to phase rotators. Set this field as follows for the given Transfer rate: '1000'b - 666 MTs '0100'b - 800 MTs '1100'b - 1066 MTs '0010'b - 1333 MTs '1010'b - 1600 MTs '0110'b - 1866 MTs '1001'b - 2133 MTs '1001'b - 2400 MTs All other values reserved. When this field is set to '0000'b, the DDR PHY is not operational.
52:55	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P0_DP18_0_POST_CURSOR: Post Cursor Bits 4:7 are connected to inputs SxPOSTCURSOR{0-3} on the analog core. This field selects the amount of equalization enabled in the data drivers. While this vector determines whether a subset of the slices in each IO operate in either a normal data or post cursor data regime, it is the data history which determines the amount of equalization provided at the driver output at any time. 0001 to 1111 = Equalization Equalization determined by the impedance of the driver, The number of P an N slices on and the value of the post cursor. Equalization is determined by the following formula: Values: NORMAL_FUNCTIONAL_MODE__NO_EQUALIZATION_=>0b0000
56:59	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P0_DP18_0_SLEW_CTL: Slew Control Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings do not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 34 Ohms, Nominal process 0110 - 1111 = approximately a 180 mV increment per step. Values: 2_83_VNS_AVERAGE=>0b0000 3_35_VNS_AVERAGE=>0b0001 4_35_VNS_AVERAGE=>0b0010 5_16_VNS_AVERAGE=>0b0011 6_16_VNS_AVERAGE=>0b0100 6_50_VNS_AVERAGE=>0b0101

This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.

48:54	RW	DDRPHY_DP18_01_READ_DELAY7_RANK_PAIR1_P0_DP18_0_RD_DELAY2: Read Delay for MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm that modifies this field sets the corresponding disable bit in the registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	constant=0b0
56:62	RW	DDRPHY_DP18_01_READ_DELAY7_RANK_PAIR1_P0_DP18_0_RD_DELAY3: Read Delay for MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49:55	RW	DDRPHY_DP18_01_READ_DELAY_OFFSET1_RANK_PAIR2_P0_DP18_0_OFFSET4: Read Delay Offset for MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03, 16,17 and nn{1} = 08, 09, 10, 11, 20, 21. This value can be written via the programming interface and is stored in two's compliment form so the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.
56	RO	constant=0b0

Bits	SCOM	Field Mnemonic: Description
57:63	RW	DDRPHY_DP18_01_READ_DELAY_OFFSET1_RANK_PAIR2_P0_DP18_0_OFFSET5: Read Delay Offset for MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07, 18, 19 and nn{1} = 12, 13, 14, 15, 22, 23. This value can be written via the programming interface and is stored in two's compliment form so the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.

Register Name	***DP18 DQS Gate Delay RP2***

0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_22_RP2_REG_P0_DP18_0_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.

48:54	RW	DDRPHY_DP18_01_READ_DELAY0_RANK_PAIR2_P0_DP18_0_RD_DELAY4: Read Delay for MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm that modifies this field sets the corresponding disable bit in the registers, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	constant=0b0
56:62	RW	DDRPHY_DP18_01_READ_DELAY0_RANK_PAIR2_P0_DP18_0_RD_DELAY5: Read Delay for MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

0:49	RO	constant=0b00000000000000000000000000000000000000000000000000
50:55	RWX	DDRPHY_DP18_01_READ_EYE_SIZE5_RANK_PAIR2_P0_DP18_0_RD_EYE_SIZE4: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_01_READ_EYE_SIZE5_RANK_PAIR2_P0_DP18_0_RD_EYE_SIZE5: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field , determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

This bit is calibrated as a data bit. '0'b Indicates the DP18 bit is not used to send or receive data. Bit 0 controls MEMINTD00B(n) Bit 1 controls MEMINTD01B(n) Bit 2 controls MEMINTD02B(n) ... Bit 15 controls MEMINTD15B(n) where n is the DP18 Instance Number.

Register Name	***DP18 Data Bit Enable 1***
Mnemonic	DPHY01.DDRPHY_DP18_DATA_BIT_ENABLE1_P0_1
Address	800004010301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:55	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_DATA_BIT_ENABLE_16_23: '1'b Indicates the DP18 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. '0'b Indicates the DP18 bit is not used to send/receive data. Bit 0 controls MEMINTD16B(n) Bit 1 controls MEMINTD17B(n) Bit 2 controls MEMINTD18B(n) ... Bit 7 controls MEMINTD23B(n) where n is the DP18 Instance Number. If DATA_BIT_ENABLE16 or if DATA_BIT_ENABLE17 is '1'b, none of the QUAD*_CLK16 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE18 or if DATA_BIT_ENABLE19 is '1'b, none of the QUAD*_CLK18 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE20 or if DATA_BIT_ENABLE21 is '1'b, none of the QUAD*_CLK20 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE22 or if DATA_BIT_ENABLE23 is '1'b, none of the QUAD*_CLK22 bits can be '1'b in the registers defined in and can be '1'b This field must remain at the reset value.
56	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_DFT_FORCE_OUTPUTS: '1'b - The 24 outputs of the DP18 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is '1'b and forced to a high-imp eden ce state when the corresponding DATA_BIT_ENABLE bit is '0'b. When a DP18 output is forced to a low-z state, the value driven out, '1'b or '0'b, is determined by the corresponding DATA_BIT_DIR bit value in the registers. '0'b - The 24 outputs of the DP18 are not forced.
57	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_DFT_PRBS7_GEN_EN: '1'b - The 24 outputs of the DP18 are forced to a low-z state when the corresponding DATA_BIT_ENABLE bit is '1'b or when enabled as a write clock in the register defined in. An output is forced to a high-z state when the corresponding DATA_BIT_ENABLE bit is '0'b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: when a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in phase, synchronous clocks, edge aligned clocks, and are not differential. '0'b - The 24 outputs of the DP18 are not forced.
58	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be '0'b for proper functional operation.
59	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_HW_VALUE:
60	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_MRS_CMD_DATA_N0: This is the value that is driven by memint_d00_b - memint_d03_b, memint_d16_b, and memint_d17_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
61	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_MRS_CMD_DATA_N1: This is the value that is driven by memint_d04_b - memint_d07_b, memint_d18_b, and memint_d19_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
62	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_MRS_CMD_DATA_N2: This is the value that is driven by memint_d08_b - memint_d11_b, memint_d20_b, and memint_d21_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
63	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P0_DP18_1_MRS_CMD_DATA_N3: This is the value that is driven by memint_d12_b - memint_d15_b, memint_d22_b, and memint_d23_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.

0:47	RO	constant=0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	RW	DDRPHY_DP18_01_DATA_BIT_DIR0_P0_DP18_1_DATA_BIT_DIR_0_15: '1'b Indicates the DP18 bit is an output and continuously drives out a signal. A given bit must only be set when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. For protocols with bidirectional data buses, '0'b indicates that the DP18 bit is bidirectional and is used to send data to the memory device and to receive data from the memory device when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. For protocols with unidirectional data buses, '0'b indicates the DP18 bit in an input and is used for receiving data from the memory device when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. Bit 0 controls MEMINTD00B(n) Bit 1 controls MEMINTD01B(n) Bit 2 controls MEMINTD02B(n) ... Bit 15 controls MEMINTD15B(n) where n is the DP18 Instance Number. This field must remain at the reset value.

Register Name	***DP18 Data Bit Direction 1***
Mnemonic	DPHY01.DDRPHY_DP18_DATA_BIT_DIR1_P0_1
Address	800004030301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:53	RW	
54	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_TOXDRV_HIBERNATE: Thin ox driver hibernation disable.
55	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_ATEST_MUX_CTL_EN: '1'b - Enable ATEST1 output. '0'b - Disable ATEST1 output.
56	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_WL_ADVANCE_DISABLE: '1'b - Disable the 12 UI advance of the second to last sample in the Write Leveling calibration algorithm. '0'b - The second to last sample in the Write Leveling calibration algorithm is 14 of a memory clock cycle delayed.
57	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_DISABLE_PING_PONG: Reserved. This bit must always be written to zero. '0'b - The DQS (write strobe) write phase rotator values toggles between the two possible phase rotator values when the rank pair written is not the same as the last rank pair that was written. '1'b - The DQS (write strobe) write phase rotator values does not toggle. Each DQS (write strobe) output uses the corresponding phase rotator.
58	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_DELAY_PING_PONG_HALF: This bit must be set to '1'b due to the timing requirements of the analog core. '0'b - The DQS (write strobe) phase rotator multipex select is not delayed. '1'b - The DQS (write strobe) phase rotator mux select is not 12 SysClk clock cycle later. When this bit is set to '1'b, and the ADVANCE_PING_PONG bit is set to '1'b, the phase rotator mux select switches 12 a SysClk clock cycle early.
59	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_ADVANCE_PING_PONG: This bit must be set to '1'b due to the timing requirements of the analog core. '0'b - The DQS (write strobe) phase rotator mux select is not advanced. '1'b - The DQS (write strobe) phase rotator mux select switches 1 SysClk clock cycle early.
60	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_ATEST_MUX_CTL0: For correct functional operation, this bit must be '0'b. This bit is connected directly to the ATEST1CTL0 pin on the analog core.
61	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_ATEST_MUX_CTL1: For correct functional operation, this bit must be '0'b. This bit is connected directly to the ATEST1CTL1 pin on the analog core.
62	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_ATEST_MUX_CTL2: For correct functional operation, this bit must be '0'b. This bit is connected directly to the ATEST1CTL2 pin on the analog core.
63	RW	DDRPHY_DP18_01_DATA_BIT_DIR1_P0_DP18_1_ATEST_MUX_CTL3: For correct functional operation, this bit must be '0'b. This bit is connected directly to the ATEST1CTL3 pin on the analog core.

Mnemonic	DPHY01.DDRPHY_DP18_RX_PEAK_AMP_P0_1
Address	800004060301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:50	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_1_PEAK_AMP_CTL_SIDE0: Peaking amplifier control bits for side 0 of the DP18. This includes the following DP18 pins: MEMINTD00B - MEMINTD07B and MEMINTD16B - MEMINTD19B This field controls the AC peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
51	RW	
52:54	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_1_PEAK_AMP_CTL_SIDE1: Peaking amplifier control bits for side 1 of the DP18. This includes the following DP18 pins: MEMINTD08B - MEMINTD15B and MEMINTD20B - MEMINTD23B This field controls the ac peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
55	RW	
56:59	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_1_SXMCVREF_0_3: VREF Trim control signals. This field is connected directly to the S0MCVREF{0:3} and S1MCVREF{0:3} input pins on the analog core. See for more information.
60	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_1_SXPODVREF: Receiver VREF Pseudo-Open Drain mode. '0'b - 0.5*DVDD '1'b - POD mode (0.7*DVDD) This field is connected directly to the S0PODVREF and S1PODVREF inputs on the analog core.
61	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_1_DISABLE_TERMINATION: '0'b - Data and Strobe pins termination resistors are turned on during read data transfer. '1'b - Data and Strobe pins termination resistors are always off.
62:63	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P0_DP18_1_READ_CENTERING_MODE: '00'b - Data read from memory is compared to the value of bits 0:7 of register 0 of the registers. '01'b - Reserved. Do not execute Custom Read Centering with this value. '10'b - Reserved. Do not execute Custom Read Centering with this value. '11'b - Data read from memory is compared to the value of the registers, staggered across DQ lanes as specified by the registers, rotated through the four bytes of the registers every 8 beats. Use this setting for staggered, serial, and parallel modes. The values in the registers,, and determine whether staggered or serial mode is being used. Parallel mode is supported with firmware assist, but should not be used for calibration. These bits are not used if Custom read Centering is not enabled. these bits are not used during Periodic Read Centering. The expected read data is always an alternating 01010101 pattern during Periodic Read Centering. For all protocols except DDR3 and DDR4, Custom Read Centering must not be enabled. the value of the reserved location in DDR3 and DDR4 devices, and the value of the MPR registers in DDR4 memories, is written during Initial Pattern Write. See the CUSTOM_INIT_WRITE field. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR3 and DDR4 devices and is read from the reserved location of RLDRAM devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the register.

Register Name	***DP18 SysClk Phase Rotator Control***
Mnemonic	DPHY01.DDRPHY_DP18_SYSCLK_PR_P0_1
Address	800004070301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_1_SYSCLK_ENABLE: Enables the SysClk and SysClkQ phase rotators. (SYSCLKPDOWN and SYSZCLKPDOWN input on NEOANA18)
49:55	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_1_SYSCLK_ROT_OVERRIDE: This field has a dual purpose: Override Control, and Lock Control. When SYSCLK_ROT_OVERRIDE_EN = '1'b, this field is in Override Control mode. When SYSCLK_ROT_OVERRIDE_EN = '0'b, this field is in Lock Control. For Override Control: System Clock (SysClk) Phase Rotator Override Value. (binary_offset_i[0:6] inputs of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field is 'reserved'. For Lock Control: Write this field to all zeros unless instructed otherwise by your IBM representative. bit 2: Lock Select: Selects between lock status and sticky lock. '0'b - Selects the status of the lock. When the dphy_nclk detect has reached alignment between the dphy_nclk and SysClk, the BB_LOCK field is asserted. '1'b - Selects the sticky lock to the BB_LOCK field . The sticky lock is controlled by bit 4, sticky lock enable. Once the sticky lock is set, it remains set. bit 4: Sticky Lock Enable bit 5:7: '000'b - At most 1 count increment or decrement occurs to indicate lock. '001'b - At most 2 counts increment or decrement occur to indicate lock. '010'b - At most 3 counts increment or decrement occur to indicate lock. '011'b - At most 4 counts increment or decrement occur to indicate lock. '100'b - At most 5 counts increment or decrement occur to indicate lock.
56	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_1_SYSCLK_ROT_OVERRIDE_EN: Enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to '1'b. (binary_offset_override_i input of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provides the required separation. When this bit is written to '0'b and was '1'b, the SYSCLK_ROT value in the register resets to zero.
57	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_1_SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_nclk - SysClk Phase Alignment Controller (reset_all_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted after PLL locks, active for at least 5 SysClk Cycles
58	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_1_SYSCLK_PHASE_CNTL_EN: Alignment Enable to dphy_nclk - SysClk Phase Alignment Controller (pr_cntl_enable_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_1_SYSCLK_PHASE_DEFAULT_EN: Enables default start up values to be output by the dphy_nclk - SysClk Phase Alignment Controller. (xsel_w_fence_i input to the dphy_nclk to SysClk alignment circuit) Should be asserted during system reset and deasserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_1_SYSCLK_POS_EDGE_ALIGN: Edge alignment strap to dphy_nclk - SysClk Phase Alignment Controller (pos_edge_alignment_i input to the dphy_nclk to SysClk alignment circuit) '1'b - Positive edge alignment of SysClk to positive edge of dphy_nclk '0'b - Negative edge alignment of SysClk to positive edge of dphy_nclk
61	RW	DDRPHY_DP18_01_SYSCLK_PR_P0_DP18_1_CONTINUOUS_UPDATE: '1'b - The dphy_nclk - SysClk Phase Alignment Controller runs continuously and thus continuously align the dphy_nclk clock to the internal SysClk clock. '0'b - The dphy_nclk - SysClk Phase Alignment Controller only updates periodically under hardware control when an update does not interfere with the PHY functional operations. (continuous_update_i input of the dphy_nclk to SysClk alignment circuit)
62:63	RO	constant=0b00

Register Name	***DP18 DFT Digital Eye***
Mnemonic	DPHY01.DDRPHY_DP18_DFT_DIG_EYE_P0_1

48	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_NO_EYE_DETECTED: Read Centering Error. No eye detected on at least one of the data pins by one of the DP18 logic blocks.
49	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_LEADING_EDGE_NOT_FOUND: Read Centering Error. Set when at least one of the leading edges of the data eyes of the data bits are not found during a calibration.
50	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_TRAILING_EDGE_NOT_FOUND: Read Centering Error. Set when at least one of the trailing edges of the data eyes of the data bits are not found during a calibration.
51	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_INCOMPLETE_RD_CAL_N0: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
52	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_INCOMPLETE_RD_CAL_N1: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.

Bits	SCOM	Field Mnemonic: Description
53	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_INCOMPLETE_RD_CAL_N2: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
54	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_INCOMPLETE_RD_CAL_N3: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
55	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_COARSE_PATTERN_ERR_N0: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
56	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_COARSE_PATTERN_ERR_N1: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.
57	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_COARSE_PATTERN_ERR_N2: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
58	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_COARSE_PATTERN_ERR_N3: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
59	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_EYE_CLIPPING: Read Centering ErrorStatus. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, set the EYE_CLIPPLING_MASK bit be set to '1'b so that this condition is not reported as an error. When EYE_CLIPPING_MAKS is '1'b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases with the margin for inter-symbol interference and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_NO_DQS: DQS Alignment ErrorStatus. Set when a strobe edge was not detected during DQS Alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 12 UI rank-to-rank compression rule.
61	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_NO_LOCK: DQS Alignment Error and Status. Set when a phase rotator lock could not be attained on a strobe during DQS Alignment calibration. The No Lock error detect circuit detects a DQS strobe which is always '1'b or always '0'b. When a DQS strobe is always '1'b or '0'b it is considered missing or stuck. The No Lock circuit sets this bit when: a) never have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK)andb) the strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK) If a strobe is stuck or broken, its location cannot be determined and thus it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI and thus an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuckbroken strobes in a way that maintains the 12 UI rank-to-rank compression rule.
62	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_DRIFT_ERROR: Periodic Read Calibration ErrorStatus: Set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the register. The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank to rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of ECC code as the final arbiter.
63	RWX	DDRPHY_DP18_01_RD_STATUS0_P0_DP18_1_MIN_EYE: Periodic Read Calibration ErrorStatus: Set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the register. The minimum eye size can be configured to a value that would be informational or it could be configured to a limit that reflects a customers maximum tolerance for errors in which case it could be considered to be an error.

49	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_WL_ERR_CLK18: Write Leveling Error. Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 18.
50	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_WL_ERR_CLK20: Write Leveling Error. Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 20.
51	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_WL_ERR_CLK22: Write Leveling Error. Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 22.
52:55	RWX_RCLRPART	
56	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_VALID_NS_BIG_L: Write Centering Error. Set when the Write Centering algorithm did not sample valid data during big steps to the right to find the left edge of the eye.
57	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_INVALID_NS_SMALL_L: Write Centering ErrorStatus. Set when the Write Centering algorithm did not sample invalid data during small steps to the left to find the left edge of the eye. This status bit will not cause the Write Centering algorithm to stop. It will use the starting delay point as the left edge of the eye. This bit lane might be functional, but it might not be an optimal centering solution.
58	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_VALID_NS_BIG_R: Write Centering Error. Set when the Write Centering algorithm did not sample valid data during big steps to the right to find the right side of the eye.
59	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_INVALID_NS_BIG_R: Write Centering Error. Set when the Write Centering algorithm did not sample invalid data during big steps to the right to find the right side of the eye.
60	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_VALID_NS_JUMP_BACK: Write Centering Error. Set when the Write Centering Algorithm did not sample valid data during big steps to the left to find the right side of the eye.
61	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_INVALID_NS_SMALL_R: Write Centering Error. Set when the Write Centering Algorithm did not sample invalid data during small steps to the right to find the right side of the eye.
62	RWX_RCLRPART	DDRPHY_DP18_01_WR_ERROR0_P0_DP18_1_OFFSET_ERR: Write Centering Error. Set when the sum of the DQ_WR_OFFSET_N* value in the register defined in and the center value determined by the Write Centering algorithm is a negative number.
63	RWX_RCLRPART	

Register Name	*DP18 Write Error Mask 0*

0:49	RO	constant=0b00000000000000000000000000000000000000000000000000
50:55	RWX	DDRPHY_DP18_01_READ_EYE_SIZE0_RANK_PAIR0_P0_DP18_1_RD_EYE_SIZE0: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_01_READ_EYE_SIZE0_RANK_PAIR0_P0_DP18_1_RD_EYE_SIZE1: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field , determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

Mnemonic	DPHY01.DDRPHY_DP18_RD_DIA_CONFIG3_P0_1
Address	8000046D0301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P0_DP18_1_DESIRED_EDGE_CNTR_TARGET_HIGH: Allows firmware control over the maximum edges required before the Initial DQS Alignment algorithm stays locked into Tracking mode. A larger count value makes the algorithm work harder before declaring that a phase lock between DRAM DQS and internal DQSCLK has occurred. This count value must always be greater than the DESIRED_EDGE_CNTR_TARGET_LOW value. Use the DESIRED_EDGE_CNTR_TARGET_HIGH value 12 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.
56:63	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P0_DP18_1_DESIRED_EDGE_CNTR_TARGET_LOW: Allows firmware control over the minimum edges required before the Initial DQS Alignment algorithm toggles between Coarse Search and Tracking mode. A larger count value makes it simpler for the algorithm return to Coarse Search mode, and harder to enter Tracking mode. This count value must always be smaller than the DESIRED_EDGE_CNTR_TARGET_HIGH value and greater than zero. Use the DESIRED_EDGE_CNTR_TARGET_LOW value 8 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.

49:55	RW	DDRPHY_DP18_01_WRCLK_PR_P0_DP18_1_TSYS_WRCLK: Static Value of System Clock (SysClk) Phase Rotator to Write Clock (WrClk) Phase Rotator. For zero delay simulations, or simulations where the delay of the SysClk tree and the WrClk tree are equal: Set this field to '60'h.
56:63	RO	constant=0b00000000

Register Name	*DP18 IO TX Configuration 0*
Mnemonic	DPHY01.DDRPHY_DP18_IO_TX_CONFIG0_P0_1
Address	800004750301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P0_DP18_1_INTERP_SIG_SLEW: Interpolated Signal Slew Control Bits 0:3 are connected to inputs SxPRSTGH{0-3} and SYSPRSTGH{0-3} on the analog core. This field provides slew rate control to phase rotators. Set this field as follows for the given Transfer rate: '1000'b - 666 MTs '0100'b - 800 MTs '1100'b - 1066 MTs '0010'b - 1333 MTs '1010'b - 1600 MTs '0110'b - 1866 MTs '1001'b - 2133 MTs '1001'b - 2400 MTs All other values reserved. When this field is set to '0000'b, the DDR PHY is not operational.
52:55	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P0_DP18_1_POST_CURSOR: Post Cursor Bits 4:7 are connected to inputs SxPOSTCURSOR{0-3} on the analog core. This field selects the amount of equalization enabled in the data drivers. While this vector determines whether a subset of the slices in each IO operate in either a normal data or post cursor data regime, it is the data history which determines the amount of equalization provided at the driver output at any time. 0001 to 1111 = Equalization Equalization determined by the impedance of the driver, The number of P an N slices on and the value of the post cursor. Equalization is determined by the following formula: Values: NORMAL_FUNCTIONAL_MODE__NO_EQUALIZATION_=>0b0000
56:59	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P0_DP18_1_SLEW_CTL: Slew Control Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings do not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 34 Ohms, Nominal process 0110 - 1111 = approximately a 180 mV increment per step. Values: 2_83_VNS_AVERAGE=>0b0000 3_35_VNS_AVERAGE=>0b0001 4_35_VNS_AVERAGE=>0b0010 5_16_VNS_AVERAGE=>0b0011 6_16_VNS_AVERAGE=>0b0100 6_50_VNS_AVERAGE=>0b0101

60:63	RW	DDRPHY_DP18_01_DQ_WR_OFFSET_RP0_P0_DP18_1_DQ_WR_OFFSET_N3: 4 most significant bits of a 5 bit value. The 5 bit value is a two compliment number added to the center phase rotator value determined by Write Centering calibration algorithm. This value is added to the center value by the Write Centering calibration algorithm as the final step of write centering pins: MEMINTD12B(n) MEMINTD13B(n) MEMINTD14B(n) MEMINTD15B(n) MEMINTD22B(n) MEMINTD23B(n) When the pins are configured as data pins. The least significant bit of the 5 bit value is always '0'b.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49:55	RW	DDRPHY_DP18_01_DQSCLK_PR0_RANK_PAIR1_P0_DP18_1_DQSCLK_ROT_CLK_N0: DQS Clock Rotator Value to align SysClk to the incoming DQS strobe for pins MEMINTD00B-MEMINTD03B, MEMINTD16B-MEMINTD17B in register 0 and MEMINTD08B-MEMINTD11B, MEMINTD20B-MEMINTD21B in register 1. Updated by hardware.
56	RO	constant=0b0
57:63	RW	DDRPHY_DP18_01_DQSCLK_PR0_RANK_PAIR1_P0_DP18_1_DQSCLK_ROT_CLK_N1: DQS Clock Rotator Value to align SysClk to the incoming DQS strobe for pins MEMINTD04B-MEMINTD07B, MEMINTD18B-MEMINTD19B in register 0 and MEMINTD12B-MEMINTD15B, MEMINTD22B-MEMINTD23B in register 1. Updated by hardware.

Register Name	***DP18 DQSClk Phase Rotator Value 1 RP1***
Mnemonic	DPHY01.DDRPHY_DP18_DQSCLK_PR1_RANK_PAIR1_P0_1
Address	800005310301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49:55	RW	DDRPHY_DP18_01_DQSCLK_PR1_RANK_PAIR1_P0_DP18_1_DQSCLK_ROT_CLK_N0: DQS Clock Rotator Value to align SysClk to the incoming DQS strobe for pins MEMINTD00B-MEMINTD03B, MEMINTD16B-MEMINTD17B in register 0 and MEMINTD08B-MEMINTD11B, MEMINTD20B-MEMINTD21B in register 1. Updated by hardware.
56	RO	constant=0b0
57:63	RW	DDRPHY_DP18_01_DQSCLK_PR1_RANK_PAIR1_P0_DP18_1_DQSCLK_ROT_CLK_N1: DQS Clock Rotator Value to align SysClk to the incoming DQS strobe for pins MEMINTD04B-MEMINTD07B, MEMINTD18B-MEMINTD19B in register 0 and MEMINTD12B-MEMINTD15B, MEMINTD22B-MEMINTD23B in register 1. Updated by hardware.

Register Name	***DP18 Write Delay Value 0 RP1***
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_0_RP1_REG_P0_1
Address	800005380301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_0_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	***DP18 Write Delay Value 1 RP1***
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_1_RP1_REG_P0_1
Address	800005390301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_1_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	***DP18 Write Delay Value 2 RP1***
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_2_RP1_REG_P0_1
Address	8000053A0301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_2_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	***DP18 Write Delay Value 3 RP1***
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_3_RP1_REG_P0_1
Address	8000053B0301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_3_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	***DP18 Write Delay Value 4 RP1***
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_4_RP1_REG_P0_1
Address	8000053C0301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_4_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	***DP18 Write Delay Value 5 RP1***
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_5_RP1_REG_P0_1
Address	8000053D0301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_5_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	*DP18 Write Delay Value 6 RP1*
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_6_RP1_REG_P0_1
Address	8000053E0301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_6_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	*DP18 Write Delay Value 7 RP1*
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_7_RP1_REG_P0_1
Address	8000053F0301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_7_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	*DP18 Write Delay Value 8 RP1*
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_8_RP1_REG_P0_1
Address	800005400301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_8_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	*DP18 Write Delay Value 9 RP1*
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_9_RP1_REG_P0_1
Address	800005410301143F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:57	RW	DP18_01_WR_DELAY_VALUE_9_RP1_REG_P0_DP18_1_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

Register Name	*DP18 Write Delay Value 10 RP1*
Mnemonic	DPHY01.DP18_WR_DELAY_VALUE_10_RP1_REG_P0_1
Address	800005420301143F (SCOM)
