The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_01_READ_EYE_SIZE4_RANK_PAIR1_P1_DP18_0_RD_EYE_SIZE3: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

50:55	RWX	DDRPHY_DP18_01_READ_EYE_SIZE11_RANK_PAIR2_P1_DP18_0_RD_EYE_SIZE4: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49:55	RW	DDRPHY_DP18_01_READ_DELAY_OFFSET0_RANK_PAIR3_P1_DP18_0_OFFSET6: Read Delay Offset for MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03, 16,17 and nn{1} = 08, 09, 10, 11, 20, 21. This value can be written via the programming interface and is stored in two's compliment form so the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.
56	RO	constant=0b0
57:63	RW	DDRPHY_DP18_01_READ_DELAY_OFFSET0_RANK_PAIR3_P1_DP18_0_OFFSET7: Read Delay Offset for MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07, 18, 19 and nn{1} = 12, 13, 14, 15, 22, 23. This value can be written via the programming interface and is stored in two's compliment form so the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.

58:63	RWX	DDRPHY_DP18_01_READ_EYE_SIZE3_RANK_PAIR3_P1_DP18_0_RD_EYE_SIZE7: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:55	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P1_DP18_1_DATA_BIT_ENABLE_16_23: '1'b Indicates the DP18 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. '0'b Indicates the DP18 bit is not used to send/receive data. Bit 0 controls MEMINTD16B(n) Bit 1 controls MEMINTD17B(n) Bit 2 controls MEMINTD18B(n) ... Bit 7 controls MEMINTD23B(n) where n is the DP18 Instance Number. If DATA_BIT_ENABLE16 or if DATA_BIT_ENABLE17 is '1'b, none of the QUAD*_CLK16 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE18 or if DATA_BIT_ENABLE19 is '1'b, none of the QUAD*_CLK18 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE20 or if DATA_BIT_ENABLE21 is '1'b, none of the QUAD*_CLK20 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE22 or if DATA_BIT_ENABLE23 is '1'b, none of the QUAD*_CLK22 bits can be '1'b in the registers defined in and can be '1'b This field must remain at the reset value.
56	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P1_DP18_1_DFT_FORCE_OUTPUTS: '1'b - The 24 outputs of the DP18 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is '1'b and forced to a high-imp eden ce state when the corresponding DATA_BIT_ENABLE bit is '0'b. When a DP18 output is forced to a low-z state, the value driven out, '1'b or '0'b, is determined by the corresponding DATA_BIT_DIR bit value in the registers described in and. '0'b - The 24 outputs of the DP18 are not forced.
57	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P1_DP18_1_DFT_PRBS7_GEN_EN: '1'b - The 24 outputs of the DP18 are forced to a low-z state when the corresponding DATA_BIT_ENABLE bit is '1'b or when enabled as a write clock in the register defined in. An output is forced to a high-z state when the corresponding DATA_BIT_ENABLE bit is '0'b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: when a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in phase, synchronous clocks, edge aligned clocks, and are not differential. '0'b - The 24 outputs of the DP18 are not forced.
58	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P1_DP18_1_WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be '0'b for proper functional operation.
59	RW	DDRPHY_DP18_01_DATA_BIT_ENABLE1_P1_DP18_1_HW_VALUE:

Bits	SCOM	Field Mnemonic: Description

Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:63	RW	DDRPHY_DP18_01_DATA_BIT_DIR0_P1_DP18_1_DATA_BIT_DIR_0_15: '1'b Indicates the DP18 bit is an output and continuously drives out a signal. A given bit must only be set when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. For protocols with bidirectional data buses, '0'b indicates that the DP18 bit is bidirectional and is used to send data to the memory device and to receive data from the memory device when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. For protocols with unidirectional data buses, '0'b indicates the DP18 bit in an input and is used for receiving data from the memory device when the corresponding bit is set in the DP18 Data Bit Enable 0 Register. Bit 0 controls MEMINTD00B(n) Bit 1 controls MEMINTD01B(n) Bit 2 controls MEMINTD02B(n) ... Bit 15 controls MEMINTD15B(n) where n is the DP18 Instance Number. This field must remain at the reset value.

Register Name	***DP18 Data Bit Direction 1***

51	RW	
52:54	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P1_DP18_1_PEAK_AMP_CTL_SIDE1: Peaking amplifier control bits for side 1 of the DP18. This includes the following DP18 pins: MEMINTD08B - MEMINTD15B and MEMINTD20B - MEMINTD23B This field controls the ac peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
55	RW	
56:59	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P1_DP18_1_SXMCVREF_0_3: VREF Trim control signals. This field is connected directly to the S0MCVREF{0:3} and S1MCVREF{0:3} input pins on the analog core.

Bits	SCOM	Field Mnemonic: Description
60	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P1_DP18_1_SXPODVREF: Receiver VREF Pseudo-Open Drain mode. '0'b - 0.5*DVDD '1'b - POD mode (0.7*DVDD) This field is connected directly to the S0PODVREF and S1PODVREF inputs on the analog core.
61	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P1_DP18_1_DISABLE_TERMINATION: '0'b - Data and Strobe pins termination resistors are turned on during read data transfer. '1'b - Data and Strobe pins termination resistors are always off.
62:63	RW	DDRPHY_DP18_01_RX_PEAK_AMP_P1_DP18_1_READ_CENTERING_MODE: '00'b - Data read from memory is compared to the value of bits 0:7 of register 0 of the registers described in. '01'b - Reserved. Do not execute Custom Read Centering with this value. '10'b - Reserved. Do not execute Custom Read Centering with this value. '11'b - Data read from memory is compared to the value of the registers described in, staggered across DQ lanes as specified by the registers described in,, and and rotated through the four bytes of the registers described in every 8 beats. Use this setting for staggered, serial, and parallel modes. The values in the registers described in,, and determine whether staggered or serial mode is being used. Parallel mode is supported with firmware assist, but should not be used for calibration. These bits are not used if Custom read Centering is not enabled. these bits are not used during Periodic Read Centering. The expected read data is always an alternating 01010101 pattern during Periodic Read Centering. For all protocols except DDR3 and DDR4, Custom Read Centering must not be enabled. the value of the reserved location in DDR3 and DDR4 devices, and the value of the MPR registers in DDR4 memories, is written during Initial Pattern Write. See the CUSTOM_INIT_WRITE field. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR3 and DDR4 devices and is read from the reserved location of RLDRAM devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the register described in

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_DP18_01_SYSCLK_PR_P1_DP18_1_SYSCLK_ENABLE: Enables the SysClk and SysClkQ phase rotators. (SYSCLKPDOWN and SYSZCLKPDOWN input on NEOANA18)
49:55	RW	DDRPHY_DP18_01_SYSCLK_PR_P1_DP18_1_SYSCLK_ROT_OVERRIDE: This field has a dual purpose: Override Control, and Lock Control. When SYSCLK_ROT_OVERRIDE_EN = '1'b, this field is in Override Control mode. When SYSCLK_ROT_OVERRIDE_EN = '0'b, this field is in Lock Control. For Override Control: System Clock (SysClk) Phase Rotator Override Value. (binary_offset_i[0:6] inputs of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the register described in is 'reserved'. For Lock Control: Write this field to all zeros unless instructed otherwise by your IBM representative. bit 2: Lock Select: Selects between lock status and sticky lock. '0'b - Selects the status of the lock. When the dphy_nclk detect has reached alignment between the dphy_nclk and SysClk, the BB_LOCK field in the register described in is asserted. '1'b - Selects the sticky lock to the BB_LOCK field. The sticky lock is controlled by bit 4, sticky lock enable. Once the sticky lock is set, it remains set. bit 4: Sticky Lock Enable bit 5:7: '000'b - At most 1 count increment or decrement occurs to indicate lock. '001'b - At most 2 counts increment or decrement occur to indicate lock. '010'b - At most 3 counts increment or decrement occur to indicate lock. '011'b - At most 4 counts increment or decrement occur to indicate lock. '100'b - At most 5 counts increment or decrement occur to indicate lock.

Bits	SCOM	Field Mnemonic: Description
56	RW	DDRPHY_DP18_01_SYSCLK_PR_P1_DP18_1_SYSCLK_ROT_OVERRIDE_EN: Enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to '1'b. (binary_offset_override_i input of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provides the required separation. When this bit is written to '0'b and was '1'b, the SYSCLK_ROT value in the register that is described in resets to zero.
57	RW	DDRPHY_DP18_01_SYSCLK_PR_P1_DP18_1_SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_nclk - SysClk Phase Alignment Controller (reset_all_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted after PLL locks, active for at least 5 SysClk Cycles
58	RW	DDRPHY_DP18_01_SYSCLK_PR_P1_DP18_1_SYSCLK_PHASE_CNTL_EN: Alignment Enable to dphy_nclk - SysClk Phase Alignment Controller (pr_cntl_enable_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	DDRPHY_DP18_01_SYSCLK_PR_P1_DP18_1_SYSCLK_PHASE_DEFAULT_EN: Enables default start up values to be output by the dphy_nclk - SysClk Phase Alignment Controller. (xsel_w_fence_i input to the dphy_nclk to SysClk alignment circuit) Should be asserted during system reset and deasserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	DDRPHY_DP18_01_SYSCLK_PR_P1_DP18_1_SYSCLK_POS_EDGE_ALIGN: Edge alignment strap to dphy_nclk - SysClk Phase Alignment Controller (pos_edge_alignment_i input to the dphy_nclk to SysClk alignment circuit) '1'b - Positive edge alignment of SysClk to positive edge of dphy_nclk '0'b - Negative edge alignment of SysClk to positive edge of dphy_nclk
61	RW	DDRPHY_DP18_01_SYSCLK_PR_P1_DP18_1_CONTINUOUS_UPDATE: '1'b - The dphy_nclk - SysClk Phase Alignment Controller runs continuously and thus continuously align the dphy_nclk clock to the internal SysClk clock. '0'b - The dphy_nclk - SysClk Phase Alignment Controller only updates periodically under hardware control when an update does not interfere with the PHY functional operations. (continuous_update_i input of the dphy_nclk to SysClk alignment circuit)
62:63	RO	constant=0b00

Register Name	***DP18 DFT Digital Eye***
Mnemonic	DPHY23.DDRPHY_DP18_DFT_DIG_EYE_P1_1
Address	800104080301183F (SCOM)

52	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_INCOMPLETE_RD_CAL_N1: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.

Bits	SCOM	Field Mnemonic: Description
53	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_INCOMPLETE_RD_CAL_N2: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
54	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_INCOMPLETE_RD_CAL_N3: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
55	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_COARSE_PATTERN_ERR_N0: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
56	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_COARSE_PATTERN_ERR_N1: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.
57	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_COARSE_PATTERN_ERR_N2: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
58	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_COARSE_PATTERN_ERR_N3: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
59	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_EYE_CLIPPING: Read Centering ErrorStatus. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, set the EYE_CLIPPLING_MASK bit be set to '1'b so that this condition is not reported as an error. When EYE_CLIPPING_MAKS is '1'b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases with the margin for inter-symbol interference and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_NO_DQS: DQS Alignment ErrorStatus. Set when a strobe edge was not detected during DQS Alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 12 UI rank-to-rank compression rule.
61	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_NO_LOCK: DQS Alignment Error and Status. Set when a phase rotator lock could not be attained on a strobe during DQS Alignment calibration. The No Lock error detect circuit detects a DQS strobe which is always '1'b or always '0'b. When a DQS strobe is always '1'b or '0'b it is considered missing or stuck. The No Lock circuit sets this bit when: a) never have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK)andb) the strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK) If a strobe is stuck or broken, its location cannot be determined and thus it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI and thus an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuckbroken strobes in a way that maintains the 12 UI rank-to-rank compression rule.
62	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_DRIFT_ERROR: Periodic Read Calibration ErrorStatus: Set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the register described in. The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank to rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of ECC code as the final arbiter.
63	RWX	DDRPHY_DP18_01_RD_STATUS0_P1_DP18_1_MIN_EYE: Periodic Read Calibration ErrorStatus: Set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the register described in. The minimum eye size can be configured to a value that would be informational or it could be configured to a limit that reflects a customers maximum tolerance for errors in which case it could be considered to be an error.

Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:52	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P1_DP18_1_BIT_CENTERED: When the DONE bit is set, this field contains the bit number (0 to 23) on which the Write Centering algorithm has been applied.
53	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P1_DP18_1_SMALL_STEP_LEFT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the right to find the 1st valid data sample. When this bit is set, the Write Centering algorithm will begin to small step to the left to find the left edge of the eye, the 1st invalid data sample. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
54	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P1_DP18_1_BIG_STEP_RIGHT: This bit is set when invalid data is sampled when the Write Centering algorithm is small stepping to the left and finds the left edge of the eye. When this bit is set, the Write Centering algorithm will begin to big step to the right to find valid data again. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
55	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P1_DP18_1_MATCH_STEP_RIGHT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the right after finding the left edge of the eye. When this bit is set, the Write Centering algorithm will continue to big step to the right to find the right edge of the eye. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
56	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P1_DP18_1_JUMP_BACK_RIGHT: This bit is set when invalid data is sampled when the Write Centering algorithm is big stepping to the right to find the right side of the eye. When this bit is set, the Write Centering algorithm will big step to the left to find valid data. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).

Bits	SCOM	Field Mnemonic: Description
57	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P1_DP18_1_SMALL_STEP_RIGHT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the left to find valid data. When this bit is set, the Write Centering algorithm will small step to the right to find the right side of the eye, the 1st invalid data sample. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
58	RO	DDRPHY_DP18_01_WR_CNTR_STATUS0_P1_DP18_1_DONE: This bit is set when invalid data is sampled when the Write Centering algorithm is small stepping to the right to find the right side of the eye. When the Write Centering algorithm completes successfully, this bit is set and the average of the left side and right side delay values is loaded into the register defined in which corresponds to the bit being write centered. When the Write Centering algorithm finds an error, this bit is set and the current delay value being used by the algorithm is loaded into the register defined in. The bit number being write centered loaded into the BIT_CENTERED field when this bit is set. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).

0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49:55	RW	DDRPHY_DP18_01_DQSCLK_OFFSET_P1_DP18_1_DQS_OFFSET: Prevents switching to the live DQS too early in RLDRAM or DDR4 modes, or during calibration routines of all protocols. Set this field to: DQS_OFFSET = 10 + ceiling(peak_to_peak_jitter_magnitude_in_ticks 2) or more specifically: DQS_OFFSET= 2 + ceiling(peak_to_peak_jitter_magnitude_in_ticks 2) + (peak_to_peak_periodic_drift_in_ticks2)Where peak_to_peak_jitter_magnitude_in_ticks is a whole number equal to the read clock strobe (DQS) peak to peak jitter rounded up to the nearest 128th memory clock. And, peak_to_peak_periodic_drift_in_ticks is the peak to peak drift of the read clock strobe (DQS) rounded up to the nearest 128th memory clock. The + 2 term in the equation accounts for the jitter sources within the DDR PHY.

0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P1_DP18_1_DESIRED_EDGE_CNTR_TARGET_HIGH: Allows firmware control over the maximum edges required before the Initial DQS Alignment algorithm stays locked into Tracking mode. A larger count value makes the algorithm work harder before declaring that a phase lock between DRAM DQS and internal DQSCLK has occurred. This count value must always be greater than the DESIRED_EDGE_CNTR_TARGET_LOW value. Use the DESIRED_EDGE_CNTR_TARGET_HIGH value 12 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.
56:63	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P1_DP18_1_DESIRED_EDGE_CNTR_TARGET_LOW: Allows firmware control over the minimum edges required before the Initial DQS Alignment algorithm toggles between Coarse Search and Tracking mode. A larger count value makes is simpler for the algorithm return to Coarse Search mode, and harder to enter Tracking mode. This count value must always be smaller than the DESIRED_EDGE_CNTR_TARGET_HIGH value and greater than zero. Use the DESIRED_EDGE_CNTR_TARGET_LOW value 8 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.

Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P1_DP18_1_INTERP_SIG_SLEW: Interpolated Signal Slew Control Bits 0:3 are connected to inputs SxPRSTGH{0-3} and SYSPRSTGH{0-3} on the analog core. This field provides slew rate control to phase rotators. Set this field as follows for the given Transfer rate: '1000'b - 666 MTs '0100'b - 800 MTs '1100'b - 1066 MTs '0010'b - 1333 MTs '1010'b - 1600 MTs '0110'b - 1866 MTs '1001'b - 2133 MTs '1001'b - 2400 MTs All other values reserved. When this field is set to '0000'b, the DDR PHY is not operational.
52:55	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P1_DP18_1_POST_CURSOR: Post Cursor Bits 4:7 are connected to inputs SxPOSTCURSOR{0-3} on the analog core. This field selects the amount of equalization enabled in the data drivers. While this vector determines whether a subset of the slices in each IO operate in either a normal data or post cursor data regime, it is the data history which determines the amount of equalization provided at the driver output at any time. 0001 to 1111 = Equalization Equalization determined by the impedance of the driver, The number of P an N slices on and the value of the post cursor. Equalization is determined by the following formula: Values: NORMAL_FUNCTIONAL_MODE__NO_EQUALIZATION_=>0b0000
56:59	RW	DDRPHY_DP18_01_IO_TX_CONFIG0_P1_DP18_1_SLEW_CTL: Slew Control Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings do not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 34 Ohms, Nominal process 0110 - 1111 = approximately a 180 mV increment per step. Values: 2_83_VNS_AVERAGE=>0b0000 3_35_VNS_AVERAGE=>0b0001 4_35_VNS_AVERAGE=>0b0010 5_16_VNS_AVERAGE=>0b0011 6_16_VNS_AVERAGE=>0b0100 6_50_VNS_AVERAGE=>0b0101

This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.

This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers described in and, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.
56	RO	constant=0b0
57:63	RW	DDRPHY_DP18_01_READ_DELAY_OFFSET1_RANK_PAIR2_P1_DP18_1_OFFSET5: Read Delay Offset for MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07, 18, 19 and nn{1} = 12, 13, 14, 15, 22, 23. This value can be written via the programming interface and is stored in two's compliment form so the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.

Register Name	***DP18 DQS Gate Delay RP2***
Mnemonic	DPHY23.DDRPHY_DP18_DQS_GATE_DELAY_RP2_P1_1
Address	800106130301183F (SCOM)

0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:54	RW	DDRPHY_DP18_01_READ_DELAY0_RANK_PAIR2_P1_DP18_1_RD_DELAY4: Read Delay for MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm that modifies this field sets the corresponding disable bit in the registers described in and, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	constant=0b0
56:62	RW	DDRPHY_DP18_01_READ_DELAY0_RANK_PAIR2_P1_DP18_1_RD_DELAY5: Read Delay for MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers described in and, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

50:55	RWX	DDRPHY_DP18_01_READ_EYE_SIZE5_RANK_PAIR2_P1_DP18_1_RD_EYE_SIZE4: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00

0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:54	RW	DDRPHY_DP18_01_READ_DELAY7_RANK_PAIR3_P1_DP18_1_RD_DELAY6: Read Delay for MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm that modifies this field sets the corresponding disable bit in the registers described in and, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	constant=0b0
56:62	RW	DDRPHY_DP18_01_READ_DELAY7_RANK_PAIR3_P1_DP18_1_RD_DELAY7: Read Delay for MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers described in and, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

0:49	RO	constant=0b0000000000000000000000000000000000000000000000000
50:55	RWX	DDRPHY_DP18_01_READ_EYE_SIZE0_RANK_PAIR3_P1_DP18_1_RD_EYE_SIZE6: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

Bits	SCOM	Field Mnemonic: Description

Address	800108010301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_DATA_BIT_ENABLE_16_23: '1'b Indicates the DP18 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. '0'b Indicates the DP18 bit is not used to send/receive data. Bit 0 controls MEMINTD16B(n) Bit 1 controls MEMINTD17B(n) Bit 2 controls MEMINTD18B(n) ... Bit 7 controls MEMINTD23B(n) where n is the DP18 Instance Number. If DATA_BIT_ENABLE16 or if DATA_BIT_ENABLE17 is '1'b, none of the QUAD*_CLK16 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE18 or if DATA_BIT_ENABLE19 is '1'b, none of the QUAD*_CLK18 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE20 or if DATA_BIT_ENABLE21 is '1'b, none of the QUAD*_CLK20 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE22 or if DATA_BIT_ENABLE23 is '1'b, none of the QUAD*_CLK22 bits can be '1'b in the registers defined in and can be '1'b This field must remain at the reset value.
56	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_DFT_FORCE_OUTPUTS: '1'b - The 24 outputs of the DP18 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is '1'b and forced to a high-imp eden ce state when the corresponding DATA_BIT_ENABLE bit is '0'b. When a DP18 output is forced to a low-z state, the value driven out, '1'b or '0'b, is determined by the corresponding DATA_BIT_DIR bit value in the registers described in and. '0'b - The 24 outputs of the DP18 are not forced.
57	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_DFT_PRBS7_GEN_EN: '1'b - The 24 outputs of the DP18 are forced to a low-z state when the corresponding DATA_BIT_ENABLE bit is '1'b or when enabled as a write clock in the register defined in. An output is forced to a high-z state when the corresponding DATA_BIT_ENABLE bit is '0'b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: when a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in phase, synchronous clocks, edge aligned clocks, and are not differential. '0'b - The 24 outputs of the DP18 are not forced.
58	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be '0'b for proper functional operation.
59	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_HW_VALUE:

Bits	SCOM	Field Mnemonic: Description
60	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_MRS_CMD_DATA_N0: This is the value that is driven by memint_d00_b - memint_d03_b, memint_d16_b, and memint_d17_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
61	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_MRS_CMD_DATA_N1: This is the value that is driven by memint_d04_b - memint_d07_b, memint_d18_b, and memint_d19_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
62	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_MRS_CMD_DATA_N2: This is the value that is driven by memint_d08_b - memint_d11_b, memint_d20_b, and memint_d21_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
63	RW	DDRPHY_DP18_23_DATA_BIT_ENABLE1_P1_DP18_2_MRS_CMD_DATA_N3: This is the value that is driven by memint_d12_b - memint_d15_b, memint_d22_b, and memint_d23_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. Register Name	***DP18 IO RX Configuration 0***
Mnemonic	DPHY23.DDRPHY_DP18_RX_PEAK_AMP_P1_2
Address	800108060301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:50	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_2_PEAK_AMP_CTL_SIDE0: Peaking amplifier control bits for side 0 of the DP18. This includes the following DP18 pins: MEMINTD00B - MEMINTD07B and MEMINTD16B - MEMINTD19B This field controls the AC peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
51	RW	
52:54	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_2_PEAK_AMP_CTL_SIDE1: Peaking amplifier control bits for side 1 of the DP18. This includes the following DP18 pins: MEMINTD08B - MEMINTD15B and MEMINTD20B - MEMINTD23B This field controls the ac peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
55	RW	
56:59	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_2_SXMCVREF_0_3: VREF Trim control signals. This field is connected directly to the S0MCVREF{0:3} and S1MCVREF{0:3} input pins on the analog core.

Bits	SCOM	Field Mnemonic: Description
60	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_2_SXPODVREF: Receiver VREF Pseudo-Open Drain mode. '0'b - 0.5*DVDD '1'b - POD mode (0.7*DVDD) This field is connected directly to the S0PODVREF and S1PODVREF inputs on the analog core.
61	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_2_DISABLE_TERMINATION: '0'b - Data and Strobe pins termination resistors are turned on during read data transfer. '1'b - Data and Strobe pins termination resistors are always off.
62:63	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_2_READ_CENTERING_MODE: '00'b - Data read from memory is compared to the value of bits 0:7 of register 0 of the registers described in. '01'b - Reserved. Do not execute Custom Read Centering with this value. '10'b - Reserved. Do not execute Custom Read Centering with this value. '11'b - Data read from memory is compared to the value of the registers described in, staggered across DQ lanes as specified by the registers described in,, and and rotated through the four bytes of the registers described in every 8 beats. Use this setting for staggered, serial, and parallel modes. The values in the registers described in,, and determine whether staggered or serial mode is being used. Parallel mode is supported with firmware assist, but should not be used for calibration. These bits are not used if Custom read Centering is not enabled. these bits are not used during Periodic Read Centering. The expected read data is always an alternating 01010101 pattern during Periodic Read Centering. For all protocols except DDR3 and DDR4, Custom Read Centering must not be enabled. the value of the reserved location in DDR3 and DDR4 devices, and the value of the MPR registers in DDR4 memories, is written during Initial Pattern Write. See the CUSTOM_INIT_WRITE field. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR3 and DDR4 devices and is read from the reserved location of RLDRAM devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the register described in

Register Name	***DP18 SysClk Phase Rotator Control***
Mnemonic	DPHY23.DDRPHY_DP18_SYSCLK_PR_P1_2
Address	800108070301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_2_SYSCLK_ENABLE: Enables the SysClk and SysClkQ phase rotators. (SYSCLKPDOWN and SYSZCLKPDOWN input on NEOANA18)
49:55	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_2_SYSCLK_ROT_OVERRIDE: This field has a dual purpose: Override Control, and Lock Control. When SYSCLK_ROT_OVERRIDE_EN = '1'b, this field is in Override Control mode. When SYSCLK_ROT_OVERRIDE_EN = '0'b, this field is in Lock Control. For Override Control: System Clock (SysClk) Phase Rotator Override Value. (binary_offset_i[0:6] inputs of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the register described in is 'reserved'. For Lock Control: Write this field to all zeros unless instructed otherwise by your IBM representative. bit 2: Lock Select: Selects between lock status and sticky lock. '0'b - Selects the status of the lock. When the dphy_nclk detect has reached alignment between the dphy_nclk and SysClk, the BB_LOCK field in the register described in is asserted. '1'b - Selects the sticky lock to the BB_LOCK field. The sticky lock is controlled by bit 4, sticky lock enable. Once the sticky lock is set, it remains set. bit 4: Sticky Lock Enable bit 5:7: '000'b - At most 1 count increment or decrement occurs to indicate lock. '001'b - At most 2 counts increment or decrement occur to indicate lock. '010'b - At most 3 counts increment or decrement occur to indicate lock. '011'b - At most 4 counts increment or decrement occur to indicate lock. '100'b - At most 5 counts increment or decrement occur to indicate lock.

Bits	SCOM	Field Mnemonic: Description
56	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_2_SYSCLK_ROT_OVERRIDE_EN: Enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to '1'b. (binary_offset_override_i input of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provides the required separation. When this bit is written to '0'b and was '1'b, the SYSCLK_ROT value in the register that is described in resets to zero.
57	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_2_SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_nclk - SysClk Phase Alignment Controller (reset_all_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted after PLL locks, active for at least 5 SysClk Cycles
58	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_2_SYSCLK_PHASE_CNTL_EN: Alignment Enable to dphy_nclk - SysClk Phase Alignment Controller (pr_cntl_enable_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_2_SYSCLK_PHASE_DEFAULT_EN: Enables default start up values to be output by the dphy_nclk - SysClk Phase Alignment Controller. (xsel_w_fence_i input to the dphy_nclk to SysClk alignment circuit) Should be asserted during system reset and deasserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_2_SYSCLK_POS_EDGE_ALIGN: Edge alignment strap to dphy_nclk - SysClk Phase Alignment Controller (pos_edge_alignment_i input to the dphy_nclk to SysClk alignment circuit) '1'b - Positive edge alignment of SysClk to positive edge of dphy_nclk '0'b - Negative edge alignment of SysClk to positive edge of dphy_nclk
61	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_2_CONTINUOUS_UPDATE: '1'b - The dphy_nclk - SysClk Phase Alignment Controller runs continuously and thus continuously align the dphy_nclk clock to the internal SysClk clock. '0'b - The dphy_nclk - SysClk Phase Alignment Controller only updates periodically under hardware control when an update does not interfere with the PHY functional operations. (continuous_update_i input of the dphy_nclk to SysClk alignment circuit)
62:63	RO	constant=0b00

Register Name	***DP18 DFT Digital Eye***
Mnemonic	DPHY23.DDRPHY_DP18_DFT_DIG_EYE_P1_2
Address	800108080301183F (SCOM)
Attributes	
Description

This value can be written via the programming interface and is stored in two's compliment form so the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.

48	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_NO_EYE_DETECTED: Read Centering Error. No eye detected on at least one of the data pins by one of the DP18 logic blocks.
49	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_LEADING_EDGE_NOT_FOUND: Read Centering Error. Set when at least one of the leading edges of the data eyes of the data bits are not found during a calibration.
50	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_TRAILING_EDGE_NOT_FOUND: Read Centering Error. Set when at least one of the trailing edges of the data eyes of the data bits are not found during a calibration.
51	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_INCOMPLETE_RD_CAL_N0: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
52	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_INCOMPLETE_RD_CAL_N1: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.

Bits	SCOM	Field Mnemonic: Description
53	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_INCOMPLETE_RD_CAL_N2: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
54	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_INCOMPLETE_RD_CAL_N3: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
55	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_COARSE_PATTERN_ERR_N0: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
56	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_COARSE_PATTERN_ERR_N1: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.
57	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_COARSE_PATTERN_ERR_N2: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
58	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_COARSE_PATTERN_ERR_N3: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
59	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_EYE_CLIPPING: Read Centering ErrorStatus. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, set the EYE_CLIPPLING_MASK bit be set to '1'b so that this condition is not reported as an error. When EYE_CLIPPING_MAKS is '1'b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases with the margin for inter-symbol interference and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_NO_DQS: DQS Alignment ErrorStatus. Set when a strobe edge was not detected during DQS Alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 12 UI rank-to-rank compression rule.
61	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_NO_LOCK: DQS Alignment Error and Status. Set when a phase rotator lock could not be attained on a strobe during DQS Alignment calibration. The No Lock error detect circuit detects a DQS strobe which is always '1'b or always '0'b. When a DQS strobe is always '1'b or '0'b it is considered missing or stuck. The No Lock circuit sets this bit when: a) never have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK)andb) the strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK) If a strobe is stuck or broken, its location cannot be determined and thus it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI and thus an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuckbroken strobes in a way that maintains the 12 UI rank-to-rank compression rule.
62	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_DRIFT_ERROR: Periodic Read Calibration ErrorStatus: Set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the register described in. The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank to rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of ECC code as the final arbiter.
63	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_2_MIN_EYE: Periodic Read Calibration ErrorStatus: Set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the register described in. The minimum eye size can be configured to a value that would be informational or it could be configured to a limit that reflects a customers maximum tolerance for errors in which case it could be considered to be an error.

49	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_WL_ERR_CLK18: Write Leveling Error. Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 18.
50	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_WL_ERR_CLK20: Write Leveling Error. Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 20.
51	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_WL_ERR_CLK22: Write Leveling Error. Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 22.
52:55	RWX_RCLRPART	
56	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_VALID_NS_BIG_L: Write Centering Error. Set when the Write Centering algorithm did not sample valid data during big steps to the right to find the left edge of the eye.
57	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_INVALID_NS_SMALL_L: Write Centering ErrorStatus. Set when the Write Centering algorithm did not sample invalid data during small steps to the left to find the left edge of the eye. This status bit will not cause the Write Centering algorithm to stop. It will use the starting delay point as the left edge of the eye. This bit lane might be functional, but it might not be an optimal centering solution.
58	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_VALID_NS_BIG_R: Write Centering Error. Set when the Write Centering algorithm did not sample valid data during big steps to the right to find the right side of the eye.
59	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_INVALID_NS_BIG_R: Write Centering Error. Set when the Write Centering algorithm did not sample invalid data during big steps to the right to find the right side of the eye.
60	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_VALID_NS_JUMP_BACK: Write Centering Error. Set when the Write Centering Algorithm did not sample valid data during big steps to the left to find the right side of the eye.
61	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_INVALID_NS_SMALL_R: Write Centering Error. Set when the Write Centering Algorithm did not sample invalid data during small steps to the right to find the right side of the eye.
62	RWX_RCLRPART	DDRPHY_DP18_23_WR_ERROR0_P1_DP18_2_OFFSET_ERR: Write Centering Error. Set when the sum of the DQ_WR_OFFSET_N* value in the register defined in and the center value determined by the Write Centering algorithm is a negative number.
63	RWX_RCLRPART	

Register Name	*DP18 Write Error Mask 0*

0:49	RO	constant=0b0000000000000000000000000000000000000000000000000
50:55	RWX	DDRPHY_DP18_23_READ_EYE_SIZE0_RANK_PAIR0_P1_DP18_2_RD_EYE_SIZE0: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_23_READ_EYE_SIZE0_RANK_PAIR0_P1_DP18_2_RD_EYE_SIZE1: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P1_DP18_2_DESIRED_EDGE_CNTR_TARGET_HIGH: Allows firmware control over the maximum edges required before the Initial DQS Alignment algorithm stays locked into Tracking mode. A larger count value makes the algorithm work harder before declaring that a phase lock between DRAM DQS and internal DQSCLK has occurred. This count value must always be greater than the DESIRED_EDGE_CNTR_TARGET_LOW value. Use the DESIRED_EDGE_CNTR_TARGET_HIGH value 12 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.
56:63	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P1_DP18_2_DESIRED_EDGE_CNTR_TARGET_LOW: Allows firmware control over the minimum edges required before the Initial DQS Alignment algorithm toggles between Coarse Search and Tracking mode. A larger count value makes is simpler for the algorithm return to Coarse Search mode, and harder to enter Tracking mode. This count value must always be smaller than the DESIRED_EDGE_CNTR_TARGET_HIGH value and greater than zero. Use the DESIRED_EDGE_CNTR_TARGET_LOW value 8 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.

0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49:55	RW	DDRPHY_DP18_23_WRCLK_PR_P1_DP18_2_TSYS_WRCLK: Static Value of System Clock (SysClk) Phase Rotator to Write Clock (WrClk) Phase Rotator. For zero delay simulations, or simulations where the delay of the SysClk tree and the WrClk tree are equal: Set this field to '60'h.
56:63	RO	constant=0b00000000

Register Name	*DP18 IO TX Configuration 0*
Mnemonic	DPHY23.DDRPHY_DP18_IO_TX_CONFIG0_P1_2
Address	800108750301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RW	DDRPHY_DP18_23_IO_TX_CONFIG0_P1_DP18_2_INTERP_SIG_SLEW: Interpolated Signal Slew Control Bits 0:3 are connected to inputs SxPRSTGH{0-3} and SYSPRSTGH{0-3} on the analog core. This field provides slew rate control to phase rotators. Set this field as follows for the given Transfer rate: '1000'b - 666 MTs '0100'b - 800 MTs '1100'b - 1066 MTs '0010'b - 1333 MTs '1010'b - 1600 MTs '0110'b - 1866 MTs '1001'b - 2133 MTs '1001'b - 2400 MTs All other values reserved. When this field is set to '0000'b, the DDR PHY is not operational.
52:55	RW	DDRPHY_DP18_23_IO_TX_CONFIG0_P1_DP18_2_POST_CURSOR: Post Cursor Bits 4:7 are connected to inputs SxPOSTCURSOR{0-3} on the analog core. This field selects the amount of equalization enabled in the data drivers. While this vector determines whether a subset of the slices in each IO operate in either a normal data or post cursor data regime, it is the data history which determines the amount of equalization provided at the driver output at any time. 0001 to 1111 = Equalization Equalization determined by the impedance of the driver, The number of P an N slices on and the value of the post cursor. Equalization is determined by the following formula: Values: NORMAL_FUNCTIONAL_MODE__NO_EQUALIZATION_=>0b0000
56:59	RW	DDRPHY_DP18_23_IO_TX_CONFIG0_P1_DP18_2_SLEW_CTL: Slew Control Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings do not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 34 Ohms, Nominal process 0110 - 1111 = approximately a 180 mV increment per step. Values: 2_83_VNS_AVERAGE=>0b0000 3_35_VNS_AVERAGE=>0b0001 4_35_VNS_AVERAGE=>0b0010 5_16_VNS_AVERAGE=>0b0011 6_16_VNS_AVERAGE=>0b0100 6_50_VNS_AVERAGE=>0b0101

The 5 bit value is a two compliment number added to the center phase rotator value determined by Write Centering calibration algorithm. This value is added to the center value by the Write Centering calibration algorithm as the final step of write centering pins: MEMINTD12B(n) MEMINTD13B(n) MEMINTD14B(n) MEMINTD15B(n) MEMINTD22B(n) MEMINTD23B(n) When the pins are configured as data pins. The least significant bit of the 5 bit value is always '0'b.

48:54	RW	DDRPHY_DP18_23_READ_DELAY2_RANK_PAIR1_P1_DP18_2_RD_DELAY2: Read Delay for MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm that modifies this field sets the corresponding disable bit in the registers described in and, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

0:49	RO	constant=0b00000000000000000000000000000000000000000000000000000000
50:55	RWX	DDRPHY_DP18_23_READ_EYE_SIZE7_RANK_PAIR1_P1_DP18_2_RD_EYE_SIZE2: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_23_READ_EYE_SIZE7_RANK_PAIR1_P1_DP18_2_RD_EYE_SIZE3: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:57	RW	DP18_23_WR_DELAY_VALUE_10_RP2_REG_P1_DP18_2_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

50:55	RWX	DDRPHY_DP18_23_READ_EYE_SIZE0_RANK_PAIR2_P1_DP18_2_RD_EYE_SIZE4: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_23_READ_EYE_SIZE0_RANK_PAIR2_P1_DP18_2_RD_EYE_SIZE5: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. 0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:54	RW	DDRPHY_DP18_23_READ_DELAY1_RANK_PAIR3_P1_DP18_2_RD_DELAY6: Read Delay for MEMINTD{{0-11}*2}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm that modifies this field sets the corresponding disable bit in the registers described in and, this field must be set to the reset value if it exceeds the maximum allowable value via a register write.
55	RO	constant=0b0
56:62	RW	DDRPHY_DP18_23_READ_DELAY1_RANK_PAIR3_P1_DP18_2_RD_DELAY7: Read Delay for MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers described in and, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00

Register Name	***DP18 IO RX Configuration 0***
Mnemonic	DPHY23.DDRPHY_DP18_RX_PEAK_AMP_P1_3
Address	80010C060301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:50	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_3_PEAK_AMP_CTL_SIDE0: Peaking amplifier control bits for side 0 of the DP18. This includes the following DP18 pins: MEMINTD00B - MEMINTD07B and MEMINTD16B - MEMINTD19B This field controls the AC peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
51	RW	
52:54	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_3_PEAK_AMP_CTL_SIDE1: Peaking amplifier control bits for side 1 of the DP18. This includes the following DP18 pins: MEMINTD08B - MEMINTD15B and MEMINTD20B - MEMINTD23B This field controls the ac peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
55	RW	
56:59	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_3_SXMCVREF_0_3: VREF Trim control signals. This field is connected directly to the S0MCVREF{0:3} and S1MCVREF{0:3} input pins on the analog core.

Bits	SCOM	Field Mnemonic: Description
60	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_3_SXPODVREF: Receiver VREF Pseudo-Open Drain mode. '0'b - 0.5*DVDD '1'b - POD mode (0.7*DVDD) This field is connected directly to the S0PODVREF and S1PODVREF inputs on the analog core.
61	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_3_DISABLE_TERMINATION: '0'b - Data and Strobe pins termination resistors are turned on during read data transfer. '1'b - Data and Strobe pins termination resistors are always off.
62:63	RW	DDRPHY_DP18_23_RX_PEAK_AMP_P1_DP18_3_READ_CENTERING_MODE: '00'b - Data read from memory is compared to the value of bits 0:7 of register 0 of the registers described in. '01'b - Reserved. Do not execute Custom Read Centering with this value. '10'b - Reserved. Do not execute Custom Read Centering with this value. '11'b - Data read from memory is compared to the value of the registers described in, staggered across DQ lanes as specified by the registers described in,, and and rotated through the four bytes of the registers described in every 8 beats. Use this setting for staggered, serial, and parallel modes. The values in the registers described in,, and determine whether staggered or serial mode is being used. Parallel mode is supported with firmware assist, but should not be used for calibration. These bits are not used if Custom read Centering is not enabled. these bits are not used during Periodic Read Centering. The expected read data is always an alternating 01010101 pattern during Periodic Read Centering. For all protocols except DDR3 and DDR4, Custom Read Centering must not be enabled. the value of the reserved location in DDR3 and DDR4 devices, and the value of the MPR registers in DDR4 memories, is written during Initial Pattern Write. See the CUSTOM_INIT_WRITE field. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR3 and DDR4 devices and is read from the reserved location of RLDRAM devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the register described in

Register Name	***DP18 SysClk Phase Rotator Control***
Mnemonic	DPHY23.DDRPHY_DP18_SYSCLK_PR_P1_3
Address	80010C070301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_3_SYSCLK_ENABLE: Enables the SysClk and SysClkQ phase rotators. (SYSCLKPDOWN and SYSZCLKPDOWN input on NEOANA18)
49:55	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_3_SYSCLK_ROT_OVERRIDE: This field has a dual purpose: Override Control, and Lock Control. When SYSCLK_ROT_OVERRIDE_EN = '1'b, this field is in Override Control mode. When SYSCLK_ROT_OVERRIDE_EN = '0'b, this field is in Lock Control. For Override Control: System Clock (SysClk) Phase Rotator Override Value. (binary_offset_i[0:6] inputs of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the register described in is 'reserved'. For Lock Control: Write this field to all zeros unless instructed otherwise by your IBM representative. bit 2: Lock Select: Selects between lock status and sticky lock. '0'b - Selects the status of the lock. When the dphy_nclk detect has reached alignment between the dphy_nclk and SysClk, the BB_LOCK field in the register described in is asserted. '1'b - Selects the sticky lock to the BB_LOCK field. The sticky lock is controlled by bit 4, sticky lock enable. Once the sticky lock is set, it remains set. bit 4: Sticky Lock Enable bit 5:7: '000'b - At most 1 count increment or decrement occurs to indicate lock. '001'b - At most 2 counts increment or decrement occur to indicate lock. '010'b - At most 3 counts increment or decrement occur to indicate lock. '011'b - At most 4 counts increment or decrement occur to indicate lock. '100'b - At most 5 counts increment or decrement occur to indicate lock.

Bits	SCOM	Field Mnemonic: Description
56	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_3_SYSCLK_ROT_OVERRIDE_EN: Enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to '1'b. (binary_offset_override_i input of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provides the required separation. When this bit is written to '0'b and was '1'b, the SYSCLK_ROT value in the register that is described in resets to zero.
57	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_3_SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_nclk - SysClk Phase Alignment Controller (reset_all_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted after PLL locks, active for at least 5 SysClk Cycles
58	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_3_SYSCLK_PHASE_CNTL_EN: Alignment Enable to dphy_nclk - SysClk Phase Alignment Controller (pr_cntl_enable_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_3_SYSCLK_PHASE_DEFAULT_EN: Enables default start up values to be output by the dphy_nclk - SysClk Phase Alignment Controller. (xsel_w_fence_i input to the dphy_nclk to SysClk alignment circuit) Should be asserted during system reset and deasserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_3_SYSCLK_POS_EDGE_ALIGN: Edge alignment strap to dphy_nclk - SysClk Phase Alignment Controller (pos_edge_alignment_i input to the dphy_nclk to SysClk alignment circuit) '1'b - Positive edge alignment of SysClk to positive edge of dphy_nclk '0'b - Negative edge alignment of SysClk to positive edge of dphy_nclk
61	RW	DDRPHY_DP18_23_SYSCLK_PR_P1_DP18_3_CONTINUOUS_UPDATE: '1'b - The dphy_nclk - SysClk Phase Alignment Controller runs continuously and thus continuously align the dphy_nclk clock to the internal SysClk clock. '0'b - The dphy_nclk - SysClk Phase Alignment Controller only updates periodically under hardware control when an update does not interfere with the PHY functional operations. (continuous_update_i input of the dphy_nclk to SysClk alignment circuit)

48	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_NO_EYE_DETECTED: Read Centering Error. No eye detected on at least one of the data pins by one of the DP18 logic blocks.
49	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_LEADING_EDGE_NOT_FOUND: Read Centering Error. Set when at least one of the leading edges of the data eyes of the data bits are not found during a calibration.
50	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_TRAILING_EDGE_NOT_FOUND: Read Centering Error. Set when at least one of the trailing edges of the data eyes of the data bits are not found during a calibration.
51	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_INCOMPLETE_RD_CAL_N0: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
52	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_INCOMPLETE_RD_CAL_N1: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.

Bits	SCOM	Field Mnemonic: Description
53	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_INCOMPLETE_RD_CAL_N2: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
54	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_INCOMPLETE_RD_CAL_N3: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
55	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_COARSE_PATTERN_ERR_N0: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
56	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_COARSE_PATTERN_ERR_N1: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.
57	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_COARSE_PATTERN_ERR_N2: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
58	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_COARSE_PATTERN_ERR_N3: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
59	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_EYE_CLIPPING: Read Centering ErrorStatus. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, set the EYE_CLIPPLING_MASK bit be set to '1'b so that this condition is not reported as an error. When EYE_CLIPPING_MAKS is '1'b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases with the margin for inter-symbol interference and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_NO_DQS: DQS Alignment ErrorStatus. Set when a strobe edge was not detected during DQS Alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 12 UI rank-to-rank compression rule.
61	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_NO_LOCK: DQS Alignment Error and Status. Set when a phase rotator lock could not be attained on a strobe during DQS Alignment calibration. The No Lock error detect circuit detects a DQS strobe which is always '1'b or always '0'b. When a DQS strobe is always '1'b or '0'b it is considered missing or stuck. The No Lock circuit sets this bit when: a) never have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK)andb) the strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK) If a strobe is stuck or broken, its location cannot be determined and thus it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI and thus an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuckbroken strobes in a way that maintains the 12 UI rank-to-rank compression rule.
62	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_DRIFT_ERROR: Periodic Read Calibration ErrorStatus: Set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the register described in. The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank to rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of ECC code as the final arbiter.
63	RWX	DDRPHY_DP18_23_RD_STATUS0_P1_DP18_3_MIN_EYE: Periodic Read Calibration ErrorStatus: Set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the register described in. The minimum eye size can be configured to a value that would be informational or it could be configured to a limit that reflects a customers maximum tolerance for errors in which case it could be considered to be an error.

48:49	RW	DDRPHY_DP18_23_WR_LVL_STATUS0_P1_DP18_3_CLK_LEVEL: This field is valid when the DONE bit is set. This field indicates which DQS strobeclock completed write leveling. '00'b - CLK16 '01'b - CLK18 '10'b - CLK20 '11'b - CLK22
50	RW	DDRPHY_DP18_23_WR_LVL_STATUS0_P1_DP18_3_FINE_STEPPING: '0'b - Write Leveling algorithm is doing the BIG_STEP portion of the algorithm. '1'b - Write Leveling algorithm is doing the SMALL_STEP portion of the algorithm.
51	RW	DDRPHY_DP18_23_WR_LVL_STATUS0_P1_DP18_3_DONE: Set when the Write Leveling algorithm completes.
52	RW	DDRPHY_DP18_23_WR_LVL_STATUS0_P1_DP18_3_WL_ERR_CLK16: Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 16.
53	RW	DDRPHY_DP18_23_WR_LVL_STATUS0_P1_DP18_3_WL_ERR_CLK18: Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 18.
54	RW	DDRPHY_DP18_23_WR_LVL_STATUS0_P1_DP18_3_WL_ERR_CLK20: Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 20.
55	RW	DDRPHY_DP18_23_WR_LVL_STATUS0_P1_DP18_3_WL_ERR_CLK22: Set when the Write Leveling algorithm cannot find a write leveling solution for CLK 22.
56	RW	DDRPHY_DP18_23_WR_LVL_STATUS0_P1_DP18_3_ZERO_DETECTED: '0'b - Write Leveling algorithm has not detected a low ('0'b) sample. '1'b - Write Leveling algorithm has detected a low ('0'b) sample.
57:63	RO	constant=0b0000000

Register Name	***DP18 Write Centering Status 0***
Mnemonic	DPHY23.DDRPHY_DP18_WR_CNTR_STATUS0_P1_3
Address	80010C180301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000
48:52	RO	DDRPHY_DP18_23_WR_CNTR_STATUS0_P1_DP18_3_BIT_CENTERED: When the DONE bit is set, this field contains the bit number (0 to 23) on which the Write Centering algorithm has been applied.
53	RO	DDRPHY_DP18_23_WR_CNTR_STATUS0_P1_DP18_3_SMALL_STEP_LEFT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the right to find the 1st valid data sample. When this bit is set, the Write Centering algorithm will begin to small step to the left to find the left edge of the eye, the 1st invalid data sample. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
54	RO	DDRPHY_DP18_23_WR_CNTR_STATUS0_P1_DP18_3_BIG_STEP_RIGHT: This bit is set when invalid data is sampled when the Write Centering algorithm is small stepping to the left and finds the left edge of the eye. When this bit is set, the Write Centering algorithm will begin to big step to the right to find valid data again. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
55	RO	DDRPHY_DP18_23_WR_CNTR_STATUS0_P1_DP18_3_MATCH_STEP_RIGHT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the right after finding the left edge of the eye. When this bit is set, the Write Centering algorithm will continue to big step to the right to find the right edge of the eye. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
56	RO	DDRPHY_DP18_23_WR_CNTR_STATUS0_P1_DP18_3_JUMP_BACK_RIGHT: This bit is set when invalid data is sampled when the Write Centering algorithm is big stepping to the right to find the right side of the eye. When this bit is set, the Write Centering algorithm will big step to the left to find valid data. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).

Bits	SCOM	Field Mnemonic: Description
57	RO	DDRPHY_DP18_23_WR_CNTR_STATUS0_P1_DP18_3_SMALL_STEP_RIGHT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the left to find valid data. When this bit is set, the Write Centering algorithm will small step to the right to find the right side of the eye, the 1st invalid data sample. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
58	RO	DDRPHY_DP18_23_WR_CNTR_STATUS0_P1_DP18_3_DONE: This bit is set when invalid data is sampled when the Write Centering algorithm is small stepping to the right to find the right side of the eye. When the Write Centering algorithm completes successfully, this bit is set and the average of the left side and right side delay values is loaded into the register defined in which corresponds to the bit being write centered. When the Write Centering algorithm finds an error, this bit is set and the current delay value being used by the algorithm is loaded into the register defined in. The bit number being write centered loaded into the BIT_CENTERED field when this bit is set. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).

49:55	RW	DDRPHY_DP18_23_DQSCLK_OFFSET_P1_DP18_3_DQS_OFFSET: Prevents switching to the live DQS too early in RLDRAM or DDR4 modes, or during calibration routines of all protocols. Set this field to: DQS_OFFSET = 10 + ceiling(peak_to_peak_jitter_magnitude_in_ticks 2) or more specifically: DQS_OFFSET= 2 + ceiling(peak_to_peak_jitter_magnitude_in_ticks 2) + (peak_to_peak_periodic_drift_in_ticks2)Where peak_to_peak_jitter_magnitude_in_ticks is a whole number equal to the read clock strobe (DQS) peak to peak jitter rounded up to the nearest 128th memory clock. And, peak_to_peak_periodic_drift_in_ticks is the peak to peak drift of the read clock strobe (DQS) rounded up to the nearest 128th memory clock. The + 2 term in the equation accounts for the jitter sources within the DDR PHY.

50:55	RWX	DDRPHY_DP18_23_READ_EYE_SIZE7_RANK_PAIR0_P1_DP18_3_RD_EYE_SIZE0: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00

0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:57	RW	DP18_23_WR_DELAY_VALUE_13_RP1_REG_P1_DP18_3_WR_DELAYG: Write Delay for MEMINTD{0-23}B pin. This value can be written via the programming interface, or determined by the write eye centering algorithm. This value is used to determine the final write phase rotator value for the given DP18 pin. The valid range of values for this field is 0 to '1FF'h, which represents WR_DELAY128 memory clock cycles of delay.
58:63	RO	constant=0b000000

50:55	RWX	DDRPHY_DP18_23_READ_EYE_SIZE1_RANK_PAIR1_P1_DP18_3_RD_EYE_SIZE2: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_23_READ_EYE_SIZE1_RANK_PAIR1_P1_DP18_3_RD_EYE_SIZE3: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

58:63	RWX	DDRPHY_DP18_23_READ_EYE_SIZE7_RANK_PAIR2_P1_DP18_3_RD_EYE_SIZE5: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

50:55	RWX	DDRPHY_DP18_23_READ_EYE_SIZE0_RANK_PAIR3_P1_DP18_3_RD_EYE_SIZE6: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

Bits	SCOM	Field Mnemonic: Description

60:63	RW	DDRPHY_DP18_23_DQ_WR_OFFSET_RP3_P1_DP18_3_DQ_WR_OFFSET_N3: 4 most significant bits of a 5 bit value. The 5 bit value is a two compliment number added to the center phase rotator value determined by Write Centering calibration algorithm. This value is added to the center value by the Write Centering calibration algorithm as the final step of write centering pins: MEMINTD12B(n) MEMINTD13B(n) MEMINTD14B(n) MEMINTD15B(n) MEMINTD22B(n) MEMINTD23B(n) When the pins are configured as data pins. The least significant bit of the 5 bit value is always '0'b.

0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_DATA_BIT_ENABLE_16_23: '1'b Indicates the DP18 bit is enabled, and is used for sending or receiving data to or from the memory device. This bit is calibrated as a data bit. '0'b Indicates the DP18 bit is not used to send/receive data. Bit 0 controls MEMINTD16B(n) Bit 1 controls MEMINTD17B(n) Bit 2 controls MEMINTD18B(n) ... Bit 7 controls MEMINTD23B(n) where n is the DP18 Instance Number. If DATA_BIT_ENABLE16 or if DATA_BIT_ENABLE17 is '1'b, none of the QUAD*_CLK16 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE18 or if DATA_BIT_ENABLE19 is '1'b, none of the QUAD*_CLK18 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE20 or if DATA_BIT_ENABLE21 is '1'b, none of the QUAD*_CLK20 bits can be '1'b in the registers defined in and can be '1'b. If DATA_BIT_ENABLE22 or if DATA_BIT_ENABLE23 is '1'b, none of the QUAD*_CLK22 bits can be '1'b in the registers defined in and can be '1'b This field must remain at the reset value.
56	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_DFT_FORCE_OUTPUTS: '1'b - The 24 outputs of the DP18 are forced to a low-impedance state when the corresponding DATA_BIT_ENABLE bit is '1'b and forced to a high-imp eden ce state when the corresponding DATA_BIT_ENABLE bit is '0'b. When a DP18 output is forced to a low-z state, the value driven out, '1'b or '0'b, is determined by the corresponding DATA_BIT_DIR bit value in the registers described in and. '0'b - The 24 outputs of the DP18 are not forced.
57	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_DFT_PRBS7_GEN_EN: '1'b - The 24 outputs of the DP18 are forced to a low-z state when the corresponding DATA_BIT_ENABLE bit is '1'b or when enabled as a write clock in the register defined in. An output is forced to a high-z state when the corresponding DATA_BIT_ENABLE bit is '0'b and not enabled as a write clock. When a pin is enabled via the corresponding DATA_BIT_ENABLE bit, the PRBS7 pattern is driven out. When a pin is enabled as a clock, a free running clock is driven out. Note: when a clock is enabled as differential, both outputs drive out the same free running clock. The two clocks are in phase, synchronous clocks, edge aligned clocks, and are not differential. '0'b - The 24 outputs of the DP18 are not forced.
58	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_WRAPSEL: This bit is connected directly to the S0WRAPSEL and S1WRAPSEL input pins of the analog core. This bit is used during wrap tests of the analog core. This bit must be '0'b for proper functional operation.
59	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_HW_VALUE:

Bits	SCOM	Field Mnemonic: Description
60	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_MRS_CMD_DATA_N0: This is the value that is driven by memint_d00_b - memint_d03_b, memint_d16_b, and memint_d17_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
61	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_MRS_CMD_DATA_N1: This is the value that is driven by memint_d04_b - memint_d07_b, memint_d18_b, and memint_d19_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
62	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_MRS_CMD_DATA_N2: This is the value that is driven by memint_d08_b - memint_d11_b, memint_d20_b, and memint_d21_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.
63	RW	DDRPHY_DP18_4_DATA_BIT_ENABLE1_P1_DP18_4_MRS_CMD_DATA_N3: This is the value that is driven by memint_d12_b - memint_d15_b, memint_d22_b, and memint_d23_b if they are enabled as DQ bits when a DDR4 MRS command is detected and this function is enabled in the register defined in. During DDR4 calibrations (initial and periodic) when this function is enabled, all data bits are driven to '0'b.

'1'b - MEMINTD22B(n) pin is configured as single-ended to send an outgoing clock or strobe to capture data. This bit must be set to the same value in each valid rank pair register.
62	RW	DDRPHY_DP18_4_WRCLK_EN_RP0_P1_DP18_4_QUAD2_CLK18: '1'b - MEMINTD18B(n), and MEMINTD19B(n) when configured as differential, is used as an outgoing clock to capture data on the following pins when the following pins are enabled and configured as outputs: MEMINTD08B(n) MEMINTD09B(n) MEMINTD10B(n) MEMINTD11B(n) MEMINTD20B(n) MEMINTD21B(n) Where n is the DP18 Instance Number.
63	RW	DDRPHY_DP18_4_WRCLK_EN_RP0_P1_DP18_4_QUAD3_CLK18: '1'b - MEMINTD18B(n), and MEMINTD19B(n) when configured as differential, is used as an outgoing clock to capture data on the following pins when the following pins are enabled and configured as outputs: MEMINTD12B(n) MEMINTD13B(n) MEMINTD14B(n) MEMINTD15B(n) MEMINTD22B(n) MEMINTD23B(n) Where n is the DP18 Instance Number.

Register Name	***DP18 IO RX Configuration 0***
Mnemonic	DPHY23.DDRPHY_DP18_RX_PEAK_AMP_P1_4
Address	800110060301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:50	RW	DDRPHY_DP18_4_RX_PEAK_AMP_P1_DP18_4_PEAK_AMP_CTL_SIDE0: Peaking amplifier control bits for side 0 of the DP18. This includes the following DP18 pins: MEMINTD00B - MEMINTD07B and MEMINTD16B - MEMINTD19B This field controls the AC peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
51	RW	
52:54	RW	DDRPHY_DP18_4_RX_PEAK_AMP_P1_DP18_4_PEAK_AMP_CTL_SIDE1: Peaking amplifier control bits for side 1 of the DP18. This includes the following DP18 pins: MEMINTD08B - MEMINTD15B and MEMINTD20B - MEMINTD23B This field controls the ac peaking of the receiver. 000 is No Peaking - Default 001 - 111 is 7 steps of peaking Peaking step Min is .3 dB, Nom is .5 dB, Max is .9 dB
55	RW	
56:59	RW	DDRPHY_DP18_4_RX_PEAK_AMP_P1_DP18_4_SXMCVREF_0_3: VREF Trim control signals. This field is connected directly to the S0MCVREF{0:3} and S1MCVREF{0:3} input pins on the analog core.

Bits	SCOM	Field Mnemonic: Description
60	RW	DDRPHY_DP18_4_RX_PEAK_AMP_P1_DP18_4_SXPODVREF: Receiver VREF Pseudo-Open Drain mode. '0'b - 0.5*DVDD '1'b - POD mode (0.7*DVDD) This field is connected directly to the S0PODVREF and S1PODVREF inputs on the analog core.
61	RW	DDRPHY_DP18_4_RX_PEAK_AMP_P1_DP18_4_DISABLE_TERMINATION: '0'b - Data and Strobe pins termination resistors are turned on during read data transfer. '1'b - Data and Strobe pins termination resistors are always off.
62:63	RW	DDRPHY_DP18_4_RX_PEAK_AMP_P1_DP18_4_READ_CENTERING_MODE: '00'b - Data read from memory is compared to the value of bits 0:7 of register 0 of the registers described in. '01'b - Reserved. Do not execute Custom Read Centering with this value. '10'b - Reserved. Do not execute Custom Read Centering with this value. '11'b - Data read from memory is compared to the value of the registers described in, staggered across DQ lanes as specified by the registers described in,, and and rotated through the four bytes of the registers described in every 8 beats. Use this setting for staggered, serial, and parallel modes. The values in the registers described in,, and determine whether staggered or serial mode is being used. Parallel mode is supported with firmware assist, but should not be used for calibration. These bits are not used if Custom read Centering is not enabled. these bits are not used during Periodic Read Centering. The expected read data is always an alternating 01010101 pattern during Periodic Read Centering. For all protocols except DDR3 and DDR4, Custom Read Centering must not be enabled. the value of the reserved location in DDR3 and DDR4 devices, and the value of the MPR registers in DDR4 memories, is written during Initial Pattern Write. See the CUSTOM_INIT_WRITE field. For reference, the alternating 01010101 pattern used during initial read centering and periodic read centering is typically read from the MPR0 register of DDR3 and DDR4 devices and is read from the reserved location of RLDRAM devices. The first bit of the expected 01010101 data pattern is controlled by the MPR_PATTERN_BIT of the register described in

Register Name	***DP18 SysClk Phase Rotator Control***
Mnemonic	DPHY23.DDRPHY_DP18_SYSCLK_PR_P1_4
Address	800110070301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_DP18_4_SYSCLK_PR_P1_DP18_4_SYSCLK_ENABLE: Enables the SysClk and SysClkQ phase rotators. (SYSCLKPDOWN and SYSZCLKPDOWN input on NEOANA18)
49:55	RW	DDRPHY_DP18_4_SYSCLK_PR_P1_DP18_4_SYSCLK_ROT_OVERRIDE: This field has a dual purpose: Override Control, and Lock Control. When SYSCLK_ROT_OVERRIDE_EN = '1'b, this field is in Override Control mode. When SYSCLK_ROT_OVERRIDE_EN = '0'b, this field is in Lock Control. For Override Control: System Clock (SysClk) Phase Rotator Override Value. (binary_offset_i[0:6] inputs of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the register described in is 'reserved'. For Lock Control: Write this field to all zeros unless instructed otherwise by your IBM representative. bit 2: Lock Select: Selects between lock status and sticky lock. '0'b - Selects the status of the lock. When the dphy_nclk detect has reached alignment between the dphy_nclk and SysClk, the BB_LOCK field in the register described in is asserted. '1'b - Selects the sticky lock to the BB_LOCK field. The sticky lock is controlled by bit 4, sticky lock enable. Once the sticky lock is set, it remains set. bit 4: Sticky Lock Enable bit 5:7: '000'b - At most 1 count increment or decrement occurs to indicate lock. '001'b - At most 2 counts increment or decrement occur to indicate lock. '010'b - At most 3 counts increment or decrement occur to indicate lock. '011'b - At most 4 counts increment or decrement occur to indicate lock. '100'b - At most 5 counts increment or decrement occur to indicate lock.

Bits	SCOM	Field Mnemonic: Description
56	RW	DDRPHY_DP18_4_SYSCLK_PR_P1_DP18_4_SYSCLK_ROT_OVERRIDE_EN: Enables the use of the SYSCLK_ROT_OVERRIDE field rather than the internally calculated SYSCLK_ROT value when set to '1'b. (binary_offset_override_i input of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provides the required separation. When this bit is written to '0'b and was '1'b, the SYSCLK_ROT value in the register that is described in resets to zero.
57	RW	DDRPHY_DP18_4_SYSCLK_PR_P1_DP18_4_SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_nclk - SysClk Phase Alignment Controller (reset_all_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted after PLL locks, active for at least 5 SysClk Cycles
58	RW	DDRPHY_DP18_4_SYSCLK_PR_P1_DP18_4_SYSCLK_PHASE_CNTL_EN: Alignment Enable to dphy_nclk - SysClk Phase Alignment Controller (pr_cntl_enable_i input to the dphy_nclk to SysClk alignment circuit) Must be asserted low at least 25 SysClk cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	DDRPHY_DP18_4_SYSCLK_PR_P1_DP18_4_SYSCLK_PHASE_DEFAULT_EN: Enables default start up values to be output by the dphy_nclk - SysClk Phase Alignment Controller. (xsel_w_fence_i input to the dphy_nclk to SysClk alignment circuit) Should be asserted during system reset and deasserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	DDRPHY_DP18_4_SYSCLK_PR_P1_DP18_4_SYSCLK_POS_EDGE_ALIGN: Edge alignment strap to dphy_nclk - SysClk Phase Alignment Controller (pos_edge_alignment_i input to the dphy_nclk to SysClk alignment circuit) '1'b - Positive edge alignment of SysClk to positive edge of dphy_nclk '0'b - Negative edge alignment of SysClk to positive edge of dphy_nclk
61	RW	DDRPHY_DP18_4_SYSCLK_PR_P1_DP18_4_CONTINUOUS_UPDATE: '1'b - The dphy_nclk - SysClk Phase Alignment Controller runs continuously and thus continuously align the dphy_nclk clock to the internal SysClk clock. '0'b - The dphy_nclk - SysClk Phase Alignment Controller only updates periodically under hardware control when an update does not interfere with the PHY functional operations. (continuous_update_i input of the dphy_nclk to SysClk alignment circuit)
62:63	RO	constant=0b00

Register Name	***DP18 DFT Digital Eye***
Mnemonic	DPHY23.DDRPHY_DP18_DFT_DIG_EYE_P1_4
Address	800110080301183F (SCOM)

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000
48	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_NO_EYE_DETECTED: Read Centering Error. No eye detected on at least one of the data pins by one of the DP18 logic blocks.
49	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_LEADING_EDGE_NOT_FOUND: Read Centering Error. Set when at least one of the leading edges of the data eyes of the data bits are not found during a calibration.
50	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_TRAILING_EDGE_NOT_FOUND: Read Centering Error. Set when at least one of the trailing edges of the data eyes of the data bits are not found during a calibration.
51	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_INCOMPLETE_RD_CAL_N0: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
52	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_INCOMPLETE_RD_CAL_N1: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.

Bits	SCOM	Field Mnemonic: Description
53	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_INCOMPLETE_RD_CAL_N2: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a a read calibration operation on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
54	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_INCOMPLETE_RD_CAL_N3: Read CenteringDQS AlignmentCoarse Read Alignment Error: Set when bit 0, 1, 2, 7, 8, 9, 10, 11, 12, or 13 of this register is set, or would be set if masked, due to a read calibration operation on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
55	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_COARSE_PATTERN_ERR_N0: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD00B-MEMINTD03B or MEMINTD16B-MEMINTD17B.
56	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_COARSE_PATTERN_ERR_N1: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD04B-MEMINTD07B or MEMINTD18B-MEMINTD19B.
57	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_COARSE_PATTERN_ERR_N2: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD08B-MEMINTD11B or MEMINTD20B-MEMINTD21B.
58	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_COARSE_PATTERN_ERR_N3: Coarse Read Alignment Error. Set when the Coarse Read Alignment algorithm does not receive a valid pattern fragment on pins MEMINTD12B-MEMINTD15B or MEMINTD22B-MEMINTD23B.
59	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_EYE_CLIPPING: Read Centering ErrorStatus. This bit activates whenever the eye center is out of the range of the strobe delay line. This is an expected condition for negative values of Trdqsdq (DQ arrives before DQS). The DDR PHY is usually capable of compensating for this. In a typical configuration, set the EYE_CLIPPLING_MASK bit be set to '1'b so that this condition is not reported as an error. When EYE_CLIPPING_MAKS is '1'b, the read centering algorithm continues calibration by using an adjacent DQS edge to perform centering. This configures normal operation of the DDR PHY in most cases with the margin for inter-symbol interference and random noise is reduced. The extent of margin reduction is dependent on jitter and the DCD characteristics of the DRAM.
60	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_NO_DQS: DQS Alignment ErrorStatus. Set when a strobe edge was not detected during DQS Alignment calibration. If a strobe is stuck or broken, its location cannot be determined. Thus, it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI. Therefore, an extra cycle of gap on rank-to-rank switching must be maintained. You can use the firmware to recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings that are associated with stuck or broken strobes to maintain the 12 UI rank-to-rank compression rule.
61	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_NO_LOCK: DQS Alignment Error and Status. Set when a phase rotator lock could not be attained on a strobe during DQS Alignment calibration. The No Lock error detect circuit detects a DQS strobe which is always '1'b or always '0'b. When a DQS strobe is always '1'b or '0'b it is considered missing or stuck. The No Lock circuit sets this bit when: a) never have a valid strobe for more than 30 samples (that is, 30 samples x 27 tCK per sample = 810 tCK)andb) the strobe then goes missing or stuck for at least 13 samples (that is, 13 samples x 27 tCK per sample = 351 tCK) If a strobe is stuck or broken, its location cannot be determined and thus it is not possible to guarantee that rank-to- rank switching delays differ by no more than 12 UI and thus an extra cycle of gap on rank-to-rank switching must be maintained. Firmware can optionally recover this extra cycle of gap on rank-to-rank switching by manually aligning all DQSaClk phase rotator settings associated with stuckbroken strobes in a way that maintains the 12 UI rank-to-rank compression rule.
62	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_DRIFT_ERROR: Periodic Read Calibration ErrorStatus: Set when a DQS signal has drifted further than the limit set in the MAX_DQS_DRIFT field of the register described in. The drift limit can be configured very tightly, in which case the activation of this bit is typically informational. Alternatively, it can be configured to a larger value that might indicate rank to rank switching is unreliable. Even in such a case, it can be ignored if the application uses a parity of ECC code as the final arbiter.
63	RWX	DDRPHY_DP18_4_RD_STATUS0_P1_DP18_4_MIN_EYE: Periodic Read Calibration ErrorStatus: Set when a data eye has closed to a value less than the value set in the MIN_RD_EYE_SIZE field of the register described in. The minimum eye size can be configured to a value that would be informational or it could be configured to a limit that reflects a customers maximum tolerance for errors in which case it could be considered to be an error.

Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:52	RO	DDRPHY_DP18_4_WR_CNTR_STATUS0_P1_DP18_4_BIT_CENTERED: When the DONE bit is set, this field contains the bit number (0 to 23) on which the Write Centering algorithm has been applied.
53	RO	DDRPHY_DP18_4_WR_CNTR_STATUS0_P1_DP18_4_SMALL_STEP_LEFT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the right to find the 1st valid data sample. When this bit is set, the Write Centering algorithm will begin to small step to the left to find the left edge of the eye, the 1st invalid data sample. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
54	RO	DDRPHY_DP18_4_WR_CNTR_STATUS0_P1_DP18_4_BIG_STEP_RIGHT: This bit is set when invalid data is sampled when the Write Centering algorithm is small stepping to the left and finds the left edge of the eye. When this bit is set, the Write Centering algorithm will begin to big step to the right to find valid data again. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
55	RO	DDRPHY_DP18_4_WR_CNTR_STATUS0_P1_DP18_4_MATCH_STEP_RIGHT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the right after finding the left edge of the eye. When this bit is set, the Write Centering algorithm will continue to big step to the right to find the right edge of the eye. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
56	RO	DDRPHY_DP18_4_WR_CNTR_STATUS0_P1_DP18_4_JUMP_BACK_RIGHT: This bit is set when invalid data is sampled when the Write Centering algorithm is big stepping to the right to find the right side of the eye. When this bit is set, the Write Centering algorithm will big step to the left to find valid data. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).

Bits	SCOM	Field Mnemonic: Description
57	RO	DDRPHY_DP18_4_WR_CNTR_STATUS0_P1_DP18_4_SMALL_STEP_RIGHT: This bit is set when valid data is sampled when the Write Centering algorithm is big stepping to the left to find valid data. When this bit is set, the Write Centering algorithm will small step to the right to find the right side of the eye, the 1st invalid data sample. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).
58	RO	DDRPHY_DP18_4_WR_CNTR_STATUS0_P1_DP18_4_DONE: This bit is set when invalid data is sampled when the Write Centering algorithm is small stepping to the right to find the right side of the eye. When the Write Centering algorithm completes successfully, this bit is set and the average of the left side and right side delay values is loaded into the register defined in which corresponds to the bit being write centered. When the Write Centering algorithm finds an error, this bit is set and the current delay value being used by the algorithm is loaded into the register defined in. The bit number being write centered loaded into the BIT_CENTERED field when this bit is set. This bit is reset when Write Centering starts on a new bit (DONE = '0'b or BIT_CENTERED = bit being Write Centered).

Description	

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49	RWX	DDRPHY_DP18_4_DFT_WRAP_STATUS_P1_DP18_4_CHECKER_RESET: Writing this bit to a '1' causes the SYNC and ERROR fields to clear to zero and this field self-clears.
50:51	RO	constant=0b00
52:57	ROX	DDRPHY_DP18_4_DFT_WRAP_STATUS_P1_DP18_4_SYNC: Each bit of this field is set during wrap testing when PRBS7 pattern is detected on the corresponding receive bit. The bits are tested in the following groups: 4 MEMINTD00B MEMINTD04B MEMINTD08B MEMINTD12B 5 MEMINTD01B MEMINTD05B MEMINTD09B MEMINTD13B 6 MEMINTD02B MEMINTD06B MEMINTD10B MEMINTD14B 7 MEMINTD03B MEMINTD07B MEMINTD11B MEMINTD15B 8 MEMINTD16B MEMINTD18B MEMINTD20B MEMINTD22B 9 MEMINTD17B MEMINTD19B MEMINTD21B MEMINTD23B
58:63	ROX	DDRPHY_DP18_4_DFT_WRAP_STATUS_P1_DP18_4_ERROR: Each bit of this field is set during wrap testing when the corresponding SYNC bit has been set but a subsequent received data bit does not match the PRBS7 pattern.

Register Name	***DP18 DQSClk Phase Rotator Value 0 RP0***
Mnemonic	DPHY23.DDRPHY_DP18_DQSCLK_PR0_RANK_PAIR0_P1_4

Address	800110370301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49:55	RW	DDRPHY_DP18_4_DQSCLK_OFFSET_P1_DP18_4_DQS_OFFSET: Prevents switching to the live DQS too early in RLDRAM or DDR4 modes, or during calibration routines of all protocols. Set this field to: DQS_OFFSET = 10 + ceiling(peak_to_peak_jitter_magnitude_in_ticks 2) or more specifically: DQS_OFFSET= 2 + ceiling(peak_to_peak_jitter_magnitude_in_ticks 2) + (peak_to_peak_periodic_drift_in_ticks2)Where peak_to_peak_jitter_magnitude_in_ticks is a whole number equal to the read clock strobe (DQS) peak to peak jitter rounded up to the nearest 128th memory clock. And, peak_to_peak_periodic_drift_in_ticks is the peak to peak drift of the read clock strobe (DQS) rounded up to the nearest 128th memory clock. The + 2 term in the equation accounts for the jitter sources within the DDR PHY.

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant=0b00000000000000000000000000000000000000000000000000
50:55	RWX	DDRPHY_DP18_4_READ_EYE_SIZE2_RANK_PAIR0_P1_DP18_4_RD_EYE_SIZE0: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_4_READ_EYE_SIZE2_RANK_PAIR0_P1_DP18_4_RD_EYE_SIZE1: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

Register Name	***DP18 Read Diagnostic Configuration 3***
Mnemonic	DPHY23.DDRPHY_DP18_RD_DIA_CONFIG3_P1_4
Address	8001106D0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P1_DP18_4_DESIRED_EDGE_CNTR_TARGET_HIGH: Allows firmware control over the maximum edges required before the Initial DQS Alignment algorithm stays locked into Tracking mode. A larger count value makes the algorithm work harder before declaring that a phase lock between DRAM DQS and internal DQSCLK has occurred. This count value must always be greater than the DESIRED_EDGE_CNTR_TARGET_LOW value. Use the DESIRED_EDGE_CNTR_TARGET_HIGH value 12 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.
56:63	RWX	DDRPHY_DP18_RD_DIA_CONFIG3_P1_DP18_4_DESIRED_EDGE_CNTR_TARGET_LOW: Allows firmware control over the minimum edges required before the Initial DQS Alignment algorithm toggles between Coarse Search and Tracking mode. A larger count value makes is simpler for the algorithm return to Coarse Search mode, and harder to enter Tracking mode. This count value must always be smaller than the DESIRED_EDGE_CNTR_TARGET_HIGH value and greater than zero. Use the DESIRED_EDGE_CNTR_TARGET_LOW value 8 to improve jitter filtering characteristics during the INitial DQS Alignment algorithm. This field is not used during the Periodic DQS Alignment algorithm.

49:55	RW	DDRPHY_DP18_4_WRCLK_PR_P1_DP18_4_TSYS_WRCLK: Static Value of System Clock (SysClk) Phase Rotator to Write Clock (WrClk) Phase Rotator. For zero delay simulations, or simulations where the delay of the SysClk tree and the WrClk tree are equal: Set this field to '60'h.
56:63	RO	constant=0b00000000

Register Name	*DP18 IO TX Configuration 0*
Mnemonic	DPHY23.DDRPHY_DP18_IO_TX_CONFIG0_P1_4
Address	800110750301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:51	RW	DDRPHY_DP18_4_IO_TX_CONFIG0_P1_DP18_4_INTERP_SIG_SLEW: Interpolated Signal Slew Control Bits 0:3 are connected to inputs SxPRSTGH{0-3} and SYSPRSTGH{0-3} on the analog core. This field provides slew rate control to phase rotators. Set this field as follows for the given Transfer rate: '1000'b - 666 MTs '0100'b - 800 MTs '1100'b - 1066 MTs '0010'b - 1333 MTs '1010'b - 1600 MTs '0110'b - 1866 MTs '1001'b - 2133 MTs '1001'b - 2400 MTs All other values reserved. When this field is set to '0000'b, the DDR PHY is not operational.
52:55	RW	DDRPHY_DP18_4_IO_TX_CONFIG0_P1_DP18_4_POST_CURSOR: Post Cursor Bits 4:7 are connected to inputs SxPOSTCURSOR{0-3} on the analog core. This field selects the amount of equalization enabled in the data drivers. While this vector determines whether a subset of the slices in each IO operate in either a normal data or post cursor data regime, it is the data history which determines the amount of equalization provided at the driver output at any time. 0001 to 1111 = Equalization Equalization determined by the impedance of the driver, The number of P an N slices on and the value of the post cursor. Equalization is determined by the following formula: Values: NORMAL_FUNCTIONAL_MODE__NO_EQUALIZATION_=>0b0000
56:59	RW	DDRPHY_DP18_4_IO_TX_CONFIG0_P1_DP18_4_SLEW_CTL: Slew Control Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings do not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 34 Ohms, Nominal process 0110 - 1111 = approximately a 180 mV increment per step. Values: 2_83_VNS_AVERAGE=>0b0000 3_35_VNS_AVERAGE=>0b0001 4_35_VNS_AVERAGE=>0b0010 5_16_VNS_AVERAGE=>0b0011 6_16_VNS_AVERAGE=>0b0100 6_50_VNS_AVERAGE=>0b0101
60:63	RO	constant=0b0000 Values: 2_83_VNS_AVERAGE=>0b0000 3_35_VNS_AVERAGE=>0b0001 4_35_VNS_AVERAGE=>0b0010 5_16_VNS_AVERAGE=>0b0011 6_16_VNS_AVERAGE=>0b0100 6_50_VNS_AVERAGE=>0b0101

This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers described in and, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:49	RO	constant=0b00000000000000000000000000000000000000000000000000
50:55	RWX	DDRPHY_DP18_4_READ_EYE_SIZE11_RANK_PAIR1_P1_DP18_4_RD_EYE_SIZE2: Read Eye Size for MEMINTD{{0-11}*2}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field in the described in the register in, determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.
56:57	RO	constant=0b00
58:63	RWX	DDRPHY_DP18_4_READ_EYE_SIZE11_RANK_PAIR1_P1_DP18_4_RD_EYE_SIZE3: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

Bits	SCOM	Field Mnemonic: Description
0:48	RO	constant=0b000000000000000000000000000000000000000000000000
49:55	RW	DDRPHY_DP18_4_READ_DELAY_OFFSET0_RANK_PAIR2_P1_DP18_4_OFFSET4: Read Delay Offset for MEMINTDnnB pins, where nn{0} = 00, 01, 02, 03, 16,17 and nn{1} = 08, 09, 10, 11, 20, 21. This value can be written via the programming interface and is stored in two's compliment form so the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.
56	RO	constant=0b0
57:63	RW	DDRPHY_DP18_4_READ_DELAY_OFFSET0_RANK_PAIR2_P1_DP18_4_OFFSET5: Read Delay Offset for MEMINTDnnB pins, where nn{0} = 04, 05, 06, 07, 18, 19 and nn{1} = 12, 13, 14, 15, 22, 23. This value can be written via the programming interface and is stored in two's compliment form so the range of possible values is -64 to +63. This value is added to the read delay value for the applicable pins. This register should not be set to a non-zero value unless detailed timing analysis has shown that for a particular configuration, the read centering algorithm places sampling point off from the eye center.

58:63	RWX	DDRPHY_DP18_4_READ_EYE_SIZE3_RANK_PAIR2_P1_DP18_4_RD_EYE_SIZE5: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

56:62	RW	DDRPHY_DP18_4_READ_DELAY5_RANK_PAIR3_P1_DP18_4_RD_DELAY7: Read Delay for MEMINTD{{0-11}*2+1}B pin. This value can be written via the programming interface, or determined by the read centering algorithm. This value is used to determine the final read phase rotator value for the given DP18 pin. To meet the power requirements of the analog circuits, the valid range for values of this field is 0 to '2F'h. If a calibration algorithm which modifies this field sets the corresponding disable bit in the registers described in and, then this field must be set to the reset value if it exceeds the maximum allowable value via a register write.

58:63	RWX	DDRPHY_DP18_4_READ_EYE_SIZE10_RANK_PAIR3_P1_DP18_4_RD_EYE_SIZE7: Read Eye Size for MEMINTD{{0-11}*2+1}B pin. The encoded binary number in this field is the number of DQS strobe phase rotator steps which captured valid data during the read centering calibration. This value is the size of the total eye in phase rotator steps. This value can be written via the programming interface, or determined by the read centering algorithm. This value, in addition to the corresponding RD_DELAY field determines the left right and middle of the read data eye. When this value is an even number, the larger half of the eye is to the right of the Read Delay Value.

Register Name	***DP18 Read Eye Size 11 RP3***
Mnemonic	DPHY23.DDRPHY_DP18_READ_EYE_SIZE11_RANK_PAIR3_P1_4

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_ADR_01_IO_SLEW_CTL_VALUE_P1_ADR0_SLEW_CTL0: Slew rate control vector. Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings does not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 24 Ohms, Nominal process 0000 -------- 3.61 Vns average 0001 -------- 4.33 Vns average 0010 -------- 5.41Vns average 0011 -------- 6.69 Vns average 0100 -------- 8.11Vns average 0101 ---------8.58 Vns average 0110 - 1111 = approximately 180 mV increment per step.
52:55	RW	DDRPHY_ADR_01_IO_SLEW_CTL_VALUE_P1_ADR0_SLEW_CTL1: Slew rate control vector. Values same as SLEW_CTL0.
56:59	RW	DDRPHY_ADR_01_IO_SLEW_CTL_VALUE_P1_ADR0_SLEW_CTL2: Slew rate control vector. Values same as SLEW_CTL0.
60:63	RW	DDRPHY_ADR_01_IO_SLEW_CTL_VALUE_P1_ADR0_SLEW_CTL3: Slew rate control vector. Values same as SLEW_CTL0.

Register Name	*ADR DFT Wrap Status And Control*
Mnemonic	DPHY23.DDRPHY_ADR_DFT_WRAP_STATUS_CONTROL_P1_ADR1
Address	8001440C0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	ROX	DDRPHY_ADR_01_DFT_WRAP_STATUS_CONTROL_P1_ADR1_ADR_TEST_LANE_PAIR_FAIL: For PRBS7 error detection in the mclk domain: Bit 0 represents the miscompare detect for wrap0 and wrap1. Bit 1 represents the miscompare detect for wrap2 and wrap3. Bit 2 represents the miscompare detect for wrap4 and wrap5. Bit 3 represents the miscompare detect for wrap6 and wrap7. Bit 4 represents the miscompare detect for wrap8 and wrap9. Bit 5 represents the miscompare detect for wrap10 and wrap11. Bit 6 represents the miscompare detect for wrap12 and wrap13. Bit 7 represents the miscompare detect for wrap14 and wrap15.
56	RW	DDRPHY_ADR_01_DFT_WRAP_STATUS_CONTROL_P1_ADR1_ADR_TEST_DATA_EN: When high, this bit selects macrotest data. Otherwise, functional mode is used.

Bits	SCOM	Field Mnemonic: Description
57:58	RW	DDRPHY_ADR_01_DFT_WRAP_STATUS_CONTROL_P1_ADR1_ADR_TEST_MODE: These bits are a multiplex control selector between prbs data and clock wrap swap. For Generator Multiplexing: -- For APIN-0, 4, 8, 12: -- 00: APINs receive prbs data -- 01: APINs receive the clock -- For APIN-1, 5, 9, 13: -- 00: APINs receive the clock -- 01: APINs receive prbs data -- 10: APINs receive the clock -- 11: APINs receive prbs data -- For APIN-2, 6, 10, 14: -- 00: APINs receive prbs data -- 01: APINs receive the clock -- For APIN-3, 7, 11, 15: -- 00: APINs receive the clock -- 01: APINs receive prbs data -- 10: APINs receive prbs data -- 11: APINs receive the clock For checker multiplexing: -- For WRAP-0, 4, 8, 12: -- The following example is for the WRAP0 multiplexer. -- 00: The checker receives prbs7 data from WRAP0 -- 01: The checker receives prbs7 data from WRAP1 -- 10: The checker receives prbs7 data from WRAP3 -- 11: The checker receives prbs7 data from WRAP1 -- For WRAP-1, 5, 9, 13: -- The following example is for the WRAP1 multiplexer. -- 00: The checker receives clk from WRAP1 -- 01: Checker receives clk from WRAP0 -- 10: Checker receives clk from WRAP1 -- 11: Checker receives clk from WRAP3 -- For WRAP-2, 6, 10, 14: -- The following example is for the WRAP2 multiplexer. -- 00: The checker receives prbs7 data from WRAP2 -- 01: The checker receives prbs7 data from WRAP3 -- For WRAP-3, 7, 11, 15: -- The following example is for the WRAP3 multiplexer. -- 00: The checker receives clk from WRAP3 -- 01: Checker receives clk from WRAP2
59	RW	DDRPHY_ADR_01_DFT_WRAP_STATUS_CONTROL_P1_ADR1_ADR_TEST_4TO1_MODE: When active, the prbs generates a 4-bit output every cycle. Otherwise, it outputs two bits. This signal is in the mclk domain.
60	RW	DDRPHY_ADR_01_DFT_WRAP_STATUS_CONTROL_P1_ADR1_ADR_TEST_RESET: Reset. This signal is in the mclk domain.
61	RW	DDRPHY_ADR_01_DFT_WRAP_STATUS_CONTROL_P1_ADR1_ADR_TEST_GEN_EN: Pattern generator enable, mclk domain. This signal should be active before enabling the check_enable_i; which is 8 cycles for loading the checker plus the latency between the generator and the wrap through APIN and ANA16.
62	RW	DDRPHY_ADR_01_DFT_WRAP_STATUS_CONTROL_P1_ADR1_ADR_TEST_CLEAR_ERROR: Clear error bits, mclk domain. The generator should be active before clr_error_i, and the macrotest_mode_i should be selecting WRAP clocks to all the corresponding checkers latches.
63	RW	DDRPHY_ADR_01_DFT_WRAP_STATUS_CONTROL_P1_ADR1_ADR_TEST_CHECK_EN: Enable the pattern checker, mclk domain. When active, the checker performs a prbs7 sequence check on the corresponding WRAP channel.

Register Name	***ADR I/O Slew Control Value***
Mnemonic	DPHY23.DDRPHY_ADR_IO_SLEW_CTL_VALUE_P1_ADR1
Address	8001441A0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_ADR_01_IO_SLEW_CTL_VALUE_P1_ADR1_SLEW_CTL0: Slew rate control vector. Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings does not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 24 Ohms, Nominal process 0000 -------- 3.61 Vns average 0001 -------- 4.33 Vns average 0010 -------- 5.41Vns average 0011 -------- 6.69 Vns average 0100 -------- 8.11Vns average 0101 ---------8.58 Vns average 0110 - 1111 = approximately 180 mV increment per step.
52:55	RW	DDRPHY_ADR_01_IO_SLEW_CTL_VALUE_P1_ADR1_SLEW_CTL1: Slew rate control vector. Values same as SLEW_CTL0.
56:59	RW	DDRPHY_ADR_01_IO_SLEW_CTL_VALUE_P1_ADR1_SLEW_CTL2: Slew rate control vector. Values same as SLEW_CTL0.
60:63	RW	DDRPHY_ADR_01_IO_SLEW_CTL_VALUE_P1_ADR1_SLEW_CTL3: Slew rate control vector. Values same as SLEW_CTL0.

Register Name	*ADR DFT Wrap Status And Control*
Mnemonic	DPHY23.DDRPHY_ADR_DFT_WRAP_STATUS_CONTROL_P1_ADR2
Address	8001480C0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:55	ROX	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR2_ADR_TEST_LANE_PAIR_FAIL: For PRBS7 error detection in the mclk domain: Bit 0 represents the miscompare detect for wrap0 and wrap1. Bit 1 represents the miscompare detect for wrap2 and wrap3. Bit 2 represents the miscompare detect for wrap4 and wrap5. Bit 3 represents the miscompare detect for wrap6 and wrap7. Bit 4 represents the miscompare detect for wrap8 and wrap9. Bit 5 represents the miscompare detect for wrap10 and wrap11. Bit 6 represents the miscompare detect for wrap12 and wrap13. Bit 7 represents the miscompare detect for wrap14 and wrap15.
56	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR2_ADR_TEST_DATA_EN: When high, this bit selects macrotest data. Otherwise, functional mode is used.

Bits	SCOM	Field Mnemonic: Description
57:58	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR2_ADR_TEST_MODE: These bits are a multiplex control selector between prbs data and clock wrap swap. For Generator Multiplexing: -- For APIN-0, 4, 8, 12: -- 00: APINs receive prbs data -- 01: APINs receive the clock -- For APIN-1, 5, 9, 13: -- 00: APINs receive the clock -- 01: APINs receive prbs data -- 10: APINs receive the clock -- 11: APINs receive prbs data -- For APIN-2, 6, 10, 14: -- 00: APINs receive prbs data -- 01: APINs receive the clock -- For APIN-3, 7, 11, 15: -- 00: APINs receive the clock -- 01: APINs receive prbs data -- 10: APINs receive prbs data -- 11: APINs receive the clock For checker multiplexing: -- For WRAP-0, 4, 8, 12: -- The following example is for the WRAP0 multiplexer. -- 00: The checker receives prbs7 data from WRAP0 -- 01: The checker receives prbs7 data from WRAP1 -- 10: The checker receives prbs7 data from WRAP3 -- 11: The checker receives prbs7 data from WRAP1 -- For WRAP-1, 5, 9, 13: -- The following example is for the WRAP1 multiplexer. -- 00: The checker receives clk from WRAP1 -- 01: Checker receives clk from WRAP0 -- 10: Checker receives clk from WRAP1 -- 11: Checker receives clk from WRAP3 -- For WRAP-2, 6, 10, 14: -- The following example is for the WRAP2 multiplexer. -- 00: The checker receives prbs7 data from WRAP2 -- 01: The checker receives prbs7 data from WRAP3 -- For WRAP-3, 7, 11, 15: -- The following example is for the WRAP3 multiplexer. -- 00: The checker receives clk from WRAP3 -- 01: Checker receives clk from WRAP2
59	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR2_ADR_TEST_4TO1_MODE: When active, the prbs generates a 4-bit output every cycle. Otherwise, it outputs two bits. This signal is in the mclk domain.
60	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR2_ADR_TEST_RESET: Reset. This signal is in the mclk domain.
61	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR2_ADR_TEST_GEN_EN: Pattern generator enable, mclk domain. This signal should be active before enabling the check_enable_i; which is 8 cycles for loading the checker plus the latency between the generator and the wrap through APIN and ANA16.
62	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR2_ADR_TEST_CLEAR_ERROR: Clear error bits, mclk domain. The generator should be active before clr_error_i, and the macrotest_mode_i should be selecting WRAP clocks to all the corresponding checkers latches.
63	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR2_ADR_TEST_CHECK_EN: Enable the pattern checker, mclk domain. When active, the checker performs a prbs7 sequence check on the corresponding WRAP channel.

Register Name	***ADR I/O Slew Control Value***
Mnemonic	DPHY23.DDRPHY_ADR_IO_SLEW_CTL_VALUE_P1_ADR2
Address	8001481A0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_ADR_23_IO_SLEW_CTL_VALUE_P1_ADR2_SLEW_CTL0: Slew rate control vector. Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings does not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 24 Ohms, Nominal process 0000 -------- 3.61 Vns average 0001 -------- 4.33 Vns average 0010 -------- 5.41Vns average 0011 -------- 6.69 Vns average 0100 -------- 8.11Vns average 0101 ---------8.58 Vns average 0110 - 1111 = approximately 180 mV increment per step.
52:55	RW	DDRPHY_ADR_23_IO_SLEW_CTL_VALUE_P1_ADR2_SLEW_CTL1: Slew rate control vector. Values same as SLEW_CTL0.
56:59	RW	DDRPHY_ADR_23_IO_SLEW_CTL_VALUE_P1_ADR2_SLEW_CTL2: Slew rate control vector. Values same as SLEW_CTL0.
60:63	RW	DDRPHY_ADR_23_IO_SLEW_CTL_VALUE_P1_ADR2_SLEW_CTL3: Slew rate control vector. Values same as SLEW_CTL0.

Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000
48:55	ROX	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR3_ADR_TEST_LANE_PAIR_FAIL: For PRBS7 error detection in the mclk domain: Bit 0 represents the miscompare detect for wrap0 and wrap1. Bit 1 represents the miscompare detect for wrap2 and wrap3. Bit 2 represents the miscompare detect for wrap4 and wrap5. Bit 3 represents the miscompare detect for wrap6 and wrap7. Bit 4 represents the miscompare detect for wrap8 and wrap9. Bit 5 represents the miscompare detect for wrap10 and wrap11. Bit 6 represents the miscompare detect for wrap12 and wrap13. Bit 7 represents the miscompare detect for wrap14 and wrap15.
56	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR3_ADR_TEST_DATA_EN: When high, this bit selects macrotest data. Otherwise, functional mode is used.

Bits	SCOM	Field Mnemonic: Description
57:58	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR3_ADR_TEST_MODE: These bits are a multiplex control selector between prbs data and clock wrap swap. For Generator Multiplexing: -- For APIN-0, 4, 8, 12: -- 00: APINs receive prbs data -- 01: APINs receive the clock -- For APIN-1, 5, 9, 13: -- 00: APINs receive the clock -- 01: APINs receive prbs data -- 10: APINs receive the clock -- 11: APINs receive prbs data -- For APIN-2, 6, 10, 14: -- 00: APINs receive prbs data -- 01: APINs receive the clock -- For APIN-3, 7, 11, 15: -- 00: APINs receive the clock -- 01: APINs receive prbs data -- 10: APINs receive prbs data -- 11: APINs receive the clock For checker multiplexing: -- For WRAP-0, 4, 8, 12: -- The following example is for the WRAP0 multiplexer. -- 00: The checker receives prbs7 data from WRAP0 -- 01: The checker receives prbs7 data from WRAP1 -- 10: The checker receives prbs7 data from WRAP3 -- 11: The checker receives prbs7 data from WRAP1 -- For WRAP-1, 5, 9, 13: -- The following example is for the WRAP1 multiplexer. -- 00: The checker receives clk from WRAP1 -- 01: Checker receives clk from WRAP0 -- 10: Checker receives clk from WRAP1 -- 11: Checker receives clk from WRAP3 -- For WRAP-2, 6, 10, 14: -- The following example is for the WRAP2 multiplexer. -- 00: The checker receives prbs7 data from WRAP2 -- 01: The checker receives prbs7 data from WRAP3 -- For WRAP-3, 7, 11, 15: -- The following example is for the WRAP3 multiplexer. -- 00: The checker receives clk from WRAP3 -- 01: Checker receives clk from WRAP2
59	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR3_ADR_TEST_4TO1_MODE: When active, the prbs generates a 4-bit output every cycle. Otherwise, it outputs two bits. This signal is in the mclk domain.
60	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR3_ADR_TEST_RESET: Reset. This signal is in the mclk domain.
61	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR3_ADR_TEST_GEN_EN: Pattern generator enable, mclk domain. This signal should be active before enabling the check_enable_i; which is 8 cycles for loading the checker plus the latency between the generator and the wrap through APIN and ANA16.
62	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR3_ADR_TEST_CLEAR_ERROR: Clear error bits, mclk domain. The generator should be active before clr_error_i, and the macrotest_mode_i should be selecting WRAP clocks to all the corresponding checkers latches.
63	RW	DDRPHY_ADR_23_DFT_WRAP_STATUS_CONTROL_P1_ADR3_ADR_TEST_CHECK_EN: Enable the pattern checker, mclk domain. When active, the checker performs a prbs7 sequence check on the corresponding WRAP channel.

Register Name	***ADR I/O Slew Control Value***
Mnemonic	DPHY23.DDRPHY_ADR_IO_SLEW_CTL_VALUE_P1_ADR3
Address	80014C1A0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_ADR_23_IO_SLEW_CTL_VALUE_P1_ADR3_SLEW_CTL0: Slew rate control vector. Bits 8:11 are connected to SxSLEWCTL{0-3} on the analog core. This field provides programmability of the slew rate for data drivers. The lowest dVdT settings does not support the maximum frequency of operation. The change in slew Vns is dependent on process corner and impedance setting. At 24 Ohms, Nominal process 0000 -------- 3.61 Vns average 0001 -------- 4.33 Vns average 0010 -------- 5.41Vns average 0011 -------- 6.69 Vns average 0100 -------- 8.11Vns average 0101 ---------8.58 Vns average 0110 - 1111 = approximately 180 mV increment per step.
52:55	RW	DDRPHY_ADR_23_IO_SLEW_CTL_VALUE_P1_ADR3_SLEW_CTL1: Slew rate control vector. Values same as SLEW_CTL0.
56:59	RW	DDRPHY_ADR_23_IO_SLEW_CTL_VALUE_P1_ADR3_SLEW_CTL2: Slew rate control vector. Values same as SLEW_CTL0.
60:63	RW	DDRPHY_ADR_23_IO_SLEW_CTL_VALUE_P1_ADR3_SLEW_CTL3: Slew rate control vector. Values same as SLEW_CTL0.

Register Name	***ADR SysClk Phase Rotator Control***
Mnemonic	DPHY23.DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR32S0
Address	800180320301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_SYSCLK_ENABLE: Enables the SysClk and SysClkQ phase rotators. (SYSCLKPDOWN and SYSQCLKPDOWN inputs to NEOANA32)

Bits	SCOM	Field Mnemonic: Description
49:55	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_SYSCLK_ROT_OVERRIDE: This field has a dual purpose: Override Control, and Lock Control. When SYSCLK_ROT_OVERRIDE_EN = '1'b, this field is in Override Control mode. When SYSCLK_ROT_OVERRIDE_EN = '0'b, this field is in Lock Control. For Override Control: System Clock (SysClk) Phase Rotator Override Value. (binary_offset_i[0:6] inputs of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the register described in is 'reserved'. For Lock Control: Write this field to all zeros unless instructed otherwise by your IBM representative. bit 2: Lock Select. Selects between lock status and sticky lock. '0'b - Selects the current status of the lock. When the dphy_nclk detect has reached alignment between the dphy_nclk and SysClk, the BB_LOCK field in the register described in are asserted. '1'b - Selects the sticky lock to the BB_LOCK field. The sticky lock is controlled by bit 4, sticky lock enable. When the sticky lock is set, it remains set. bit 4: Sticky Lock Enable bit 5:7: '000'b - At most 1 count increment or decrement occurs to indicate lock. '001'b - At most 2 counts increment or decrement occur to indicate lock. '010'b - At most 3 counts increment or decrement occur to indicate lock. '011'b - At most 4 counts increment or decrement occur to indicate lock. '100'b - At most 5 counts increment or decrement occur to indicate lock.
56	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_SYSCLK_ROT_OVERRIDE_EN: Enables the use of the SYSCLK_ROT_OVERRIDE register value rather than the internally calculated SYSCLK_ROT value (register 34) when set to 1. (binary_offset_override_i input of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. When this bit is written to '0'b and was '1'b, the SYSCLK_ROT value in the register that is described in is reset to zero.
57	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_nclk - SysClk Phase Alignment Controller (reset_all_i input of dphy_nclkSysClk alignment logic block) This bit must be asserted after PLL locks, active for at least 5 SysClk Cycles
58	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_SYSCLK_PHASE_CNTL_EN: Alignment Enable to dphy_nclk - SysClk Phase Alignment Controller (pr_cntl_enable_i input of dphy_nclkSysClk alignment logic block) when high enables controller. This bit must be asserted low at least 25 SysClk Cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_SYSCLK_PHASE_DEFAULT_EN: Enables default start up values to be output by the dphy_nclk - SysClk Phase Alignment Controller (xsel_w_fence_i input of dphy_nclkSysClk alignment block) should be asserted during system reset and deasserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_SYSCLK_POS_EDGE_ALIGN: Edge alignment strap to dphy_nclk - SysClk Phase Alignment Controller (pos_edge_alignment_i input of dphy_nclkSysClk alignment logic block) when high enables positive edge alignment between dphy_nclk and SysClk when low enables negative edge alignment between dphy_nclk and SysClk required to be low for ADR (negative edge alignment).
61	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_CONTINUOUS_UPDATE: '1'b - The dphy_nclk - SysClk Phase Alignment Controller runs continuously and thus continuously aligns the dphy_nclk clock to the internal SysClk clock. '0'b - The dphy_nclk - SysClk Phase Alignment Controller will only updated periodically under hardware control when an update will not interfere with the PHY functional operations. (continuous_update_i input of the dphy_nclk to SysClk alignment circuit)
62:63	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR0_CE0DLTVCC: This field must be '00'b for proper functional operation. Bit 14 is connected to the CE0DLTVCCD pin on the analog core. Bit 15 is connected to the CE0DLTVCCA pin on the analog core.

Address	800180340301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RO	DDRPHY_ADR_SYSCLK_PR_VALUE_RO_P1_ADR0_SLEW_LATE_SAMPLE: Slew late sample. This debug bit represents the value of the late sample. Once this bit is asserted, it will remain asserted until a system reset of SLEW_CAL_START is detected. The value of this bit will be undefined until 4 cycles after the Slew Calibration Enable bit register is set.
49:55	ROX	DDRPHY_ADR_SYSCLK_PR_VALUE_RO_P1_ADR0_SYSCLK_ROT: Internally Calculated Value of Memory Controller Clock (MCClk) Phase to SysClock (SysClk) Phase Offset. Used to set the SysClock phase rotator when SYSCLK_ROT_OVERRIDE_EN = 0. See the Register 32 description. (binary_offset_o[0:6] output of dphy_nclkSysClk alignment logic block) These bits reset, but are continually loaded with the dphy_nclk to SysClk alignment circuit calculated value for the SysClk delay, exclusive of reset.
56	RO	DDRPHY_ADR_SYSCLK_PR_VALUE_RO_P1_ADR0_BB_LOCK: '1'b - The dphy_nclkSysClk Phase Alignment Controller has reached alignment between the dphy_nclk and SysClk as of the last update by the dphy_nclkSysClk Phase Alignment Controller. '0'b - The dphy_nclk and SysClk are not in alignment as of the last update by the dphy_nclkSysClk Phase Alignment Controller. There are two types of locks. Refer to the SYSCLK_ROT_OVERRIDE field.
57	RO	DDRPHY_ADR_SYSCLK_PR_VALUE_RO_P1_ADR0_SLEW_EARLY_SAMPLE: Slew early sample. This debug bit represents the value of the early sample. Once this bit is asserted, it will remain asserted until a system reset or SLEW_CAL_START is detected. The value of this bit will be undefined until 4 cycles after the Slew Calibration Enable bit register is set.
58:59	ROX	DDRPHY_ADR_SYSCLK_PR_VALUE_RO_P1_ADR0_SLEW_DONE_STATUS: Slew calibration Done Status. This field indicates when the slew calibration has completed and the completion status. Once any bit in this field is asserted, it will remain asserted until a system reset or SLEW_CAL_START is detected. The Slew Calibration Algorithm will complete in 1020 dphy_nclk clock cycles '00'b - Not Done. '01'b - Done with errors. '10'b - Done with warnings. '11'b - Done with no errors. The status '01'b indicates slew calibration completed without reaching alignment. The status '10'b indicates slew calibration completed with a slew minimum delay; the calculated SLEW_CNTL value is '1111'b.
60:63	ROX	DDRPHY_ADR_SYSCLK_PR_VALUE_RO_P1_ADR0_SLEW_CNTL: Slew Control value. This field represents the slew control value calculated by the slew calibration algorithm. This calculated slew control value is used for setting the register. If any bit in this field is asserted, it will remain asserted until a system reset or SLEW_CAL_START is detected. The calibration algorithm will never calculate a value of '0000'b as a result of a calibration; however, a value of '0000'b can be set via the override field in register.

48	RW	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR0_SLEW_CAL_ENABLE: Slew Calibration Enable. This active high bit is used by the slew calibration logic as clock gate and fencing. This bit should be asserted 2000 cycle prior to performing the slew calibration cycle in order to mitigate the delay line history effect, and it must be active while the slew calibration is being performed. This bit must be de-asserted after the slew calibration logic has complete calculating the SLEW_CNTL value.
49	RWX	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR0_SLEW_CAL_START: Slew Calibration Start. When set, the slew calibration controller will commence a calibration cycle. The SLEW_CAL_ENABLE must be asserted prior to setting this bit. The hardware will clear this bit to '0'b a cycle after it is asserted.
50	RW	
51	RW	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR0_SLEW_CAL_OVERRIDE_EN: Slew Calibration Offset Override Enable. This bit indicates when to override SLEW_CNTL value with SLEW_CAL_OVERRIDE value.
52:55	RW	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR0_SLEW_CAL_OVERRIDE: Slew Calibration Offset Override vector. This field overrides SLEW_CNTL when SLEW_CAL_OVERRIDE_EN is active.
56:58	RW	
59:63	RW	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR0_SLEW_TARGET_PR_OFFSET: Slew Target Phase Rotator Offset. This field represents a phase rotator offset.

Register Name	***ADR SysClk Phase Rotator Control***
Mnemonic	DPHY23.DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR32S1
Address	800184320301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_SYSCLK_ENABLE: Enables the SysClk and SysClkQ phase rotators. (SYSCLKPDOWN and SYSQCLKPDOWN inputs to NEOANA32)
49:55	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_SYSCLK_ROT_OVERRIDE: This field has a dual purpose: Override Control, and Lock Control. When SYSCLK_ROT_OVERRIDE_EN = '1'b, this field is in Override Control mode. When SYSCLK_ROT_OVERRIDE_EN = '0'b, this field is in Lock Control. For Override Control: System Clock (SysClk) Phase Rotator Override Value. (binary_offset_i[0:6] inputs of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE_EN field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. In this mode, the BB_LOCK field in the register described in is 'reserved'. For Lock Control: Write this field to all zeros unless instructed otherwise by your IBM representative. bit 2: Lock Select. Selects between lock status and sticky lock. '0'b - Selects the current status of the lock. When the dphy_nclk detect has reached alignment between the dphy_nclk and SysClk, the BB_LOCK field in the register described in are asserted. '1'b - Selects the sticky lock to the BB_LOCK field. The sticky lock is controlled by bit 4, sticky lock enable. When the sticky lock is set, it remains set. bit 4: Sticky Lock Enable bit 5:7: '000'b - At most 1 count increment or decrement occurs to indicate lock. '001'b - At most 2 counts increment or decrement occur to indicate lock. '010'b - At most 3 counts increment or decrement occur to indicate lock. '011'b - At most 4 counts increment or decrement occur to indicate lock. '100'b - At most 5 counts increment or decrement occur to indicate lock.

Bits	SCOM	Field Mnemonic: Description
56	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_SYSCLK_ROT_OVERRIDE_EN: Enables the use of the SYSCLK_ROT_OVERRIDE register value rather than the internally calculated SYSCLK_ROT value (register 34) when set to 1. (binary_offset_override_i input of the dphy_nclk to SysClk alignment circuit) The value in this field cannot be changed in the same write operation that changes the SYSCLK_ROT_OVERRIDE field. Updates to these two fields must be separated by 4 dphy_nclk clock cycles. Back to back APB write operations to this register provide the required separation. When this bit is written to '0'b and was '1'b, the SYSCLK_ROT value in the register that is described in is reset to zero.
57	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_SYSCLK_PHASE_ALIGN_RESET: Reset to dphy_nclk - SysClk Phase Alignment Controller (reset_all_i input of dphy_nclkSysClk alignment logic block) This bit must be asserted after PLL locks, active for at least 5 SysClk Cycles
58	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_SYSCLK_PHASE_CNTL_EN: Alignment Enable to dphy_nclk - SysClk Phase Alignment Controller (pr_cntl_enable_i input of dphy_nclkSysClk alignment logic block) when high enables controller. This bit must be asserted low at least 25 SysClk Cycles before SYSCLK_ROT_OVERRIDE_EN goes active if the SYSCLK_ROT_OVERRIDE value is to be used.
59	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_SYSCLK_PHASE_DEFAULT_EN: Enables default start up values to be output by the dphy_nclk - SysClk Phase Alignment Controller (xsel_w_fence_i input of dphy_nclkSysClk alignment block) should be asserted during system reset and deasserted coincident with SYSCLK_PHASE_ALIGN_RESET.
60	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_SYSCLK_POS_EDGE_ALIGN: Edge alignment strap to dphy_nclk - SysClk Phase Alignment Controller (pos_edge_alignment_i input of dphy_nclkSysClk alignment logic block) when high enables positive edge alignment between dphy_nclk and SysClk when low enables negative edge alignment between dphy_nclk and SysClk required to be low for ADR (negative edge alignment).
61	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_CONTINUOUS_UPDATE: '1'b - The dphy_nclk - SysClk Phase Alignment Controller runs continuously and thus continuously aligns the dphy_nclk clock to the internal SysClk clock. '0'b - The dphy_nclk - SysClk Phase Alignment Controller will only updated periodically under hardware control when an update will not interfere with the PHY functional operations. (continuous_update_i input of the dphy_nclk to SysClk alignment circuit)
62:63	RW	DDRPHY_ADR_SYSCLK_CNTL_PR_P1_ADR1_CE0DLTVCC: This field must be '00'b for proper functional operation. Bit 14 is connected to the CE0DLTVCCD pin on the analog core. Bit 15 is connected to the CE0DLTVCCA pin on the analog core.

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR1_SLEW_CAL_ENABLE: Slew Calibration Enable. This active high bit is used by the slew calibration logic as clock gate and fencing. This bit should be asserted 2000 cycle prior to performing the slew calibration cycle in order to mitigate the delay line history effect, and it must be active while the slew calibration is being performed. This bit must be de-asserted after the slew calibration logic has complete calculating the SLEW_CNTL value.
49	RWX	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR1_SLEW_CAL_START: Slew Calibration Start. When set, the slew calibration controller will commence a calibration cycle. The SLEW_CAL_ENABLE must be asserted prior to setting this bit. The hardware will clear this bit to '0'b a cycle after it is asserted.
50	RW	
51	RW	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR1_SLEW_CAL_OVERRIDE_EN: Slew Calibration Offset Override Enable. This bit indicates when to override SLEW_CNTL value with SLEW_CAL_OVERRIDE value.
52:55	RW	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR1_SLEW_CAL_OVERRIDE: Slew Calibration Offset Override vector. This field overrides SLEW_CNTL when SLEW_CAL_OVERRIDE_EN is active.
56:58	RW	
59:63	RW	DDRPHY_ADR_SLEW_CAL_CNTL_P1_ADR1_SLEW_TARGET_PR_OFFSET: Slew Target Phase Rotator Offset. This field represents a phase rotator offset.

Register Name	*PC DP18 PLL Lock Status*
Mnemonic	DPHY23.DDRPHY_PC_DP18_PLL_LOCK_STATUS_P1
Address	8001C0000301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:62	ROX	DDRPHY_PC_DP18_PLL_LOCK_STATUS_P1_DP18_PLL_LOCK: One bit for each DP18 in the DDR PHY Core. When the core contains less than 15 DP18s, then bits with an index value greater than NUM_DP18 - 1 are reserved. '0'b - PLL in the bit indexed DP18 is not locked. '1'b - PLL in the bit indexed DP18 is locked. When the PHY is configured in TDM Mode, this register reports the PLL Lock Status of all the DP18s in the PHY.
63	RO	constant=0b0

Register Name	*PC AD32S PLL Lock Status*
Mnemonic	DPHY23.DDRPHY_PC_AD32S_PLL_LOCK_STATUS_P1
Address	8001C0010301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:49	ROX	DDRPHY_PC_AD32S_PLL_LOCK_STATUS_P1_AD32S_PLL_LOCK: One bit for each ADR Support Block in the DDR PHY Core. When the core contains less than 2 AD32Ss, bits with an index value greater than NUM_AD32S-1 are reserved. '0'b - PLL in the bit indexed AD32S is not locked. '1'b - PLL in the bit indexed AD32S is locked.
50:63	RO	constant=0b00000000000000

Register Name	*PC Rank Pair 0*
Mnemonic	DPHY23.DDRPHY_PC_RANK_PAIR0_P1
Address	8001C0020301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:50	RW	DDRPHY_PC_RANK_PAIR0_P1_RANK_PAIR0_PRI: Primary Rank of Rank Pair 0 When configured for a protocol that only supports a single rank system, this field must be set to 0.
51	RW	DDRPHY_PC_RANK_PAIR0_P1_RANK_PAIR0_PRI_V: Value in the RANK_PAIR0_PRI field is valid
52:54	RW	DDRPHY_PC_RANK_PAIR0_P1_RANK_PAIR0_SEC: Secondary Rank of Rank Pair 0
55	RW	DDRPHY_PC_RANK_PAIR0_P1_RANK_PAIR0_SEC_V: Value in the RANK_PAIR0_SEC field is valid. If this bit is set, the RANK_PAIR0_PRI_V bit must be set.
56:58	RW	DDRPHY_PC_RANK_PAIR0_P1_RANK_PAIR1_PRI: Primary Rank of Rank Pair 1
59	RW	DDRPHY_PC_RANK_PAIR0_P1_RANK_PAIR1_PRI_V: Value in the RANK_PAIR1_PRI field is valid. If this bit is set, the RANK_PAIR0_PRI_V bit must be set.
60:62	RW	DDRPHY_PC_RANK_PAIR0_P1_RANK_PAIR1_SEC: Secondary Rank of Rank Pair 1
63	RW	DDRPHY_PC_RANK_PAIR0_P1_RANK_PAIR1_SEC_V: Value in the RANK_PAIR1_SEC field is valid. If this bit is set, the RANK_PAIR1_PRI_V bit must be set.

Register Name	*PC Rank Pair 1*
Mnemonic	DPHY23.DDRPHY_PC_RANK_PAIR1_P1
Address	8001C0030301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:50	RW	DDRPHY_PC_RANK_PAIR1_P1_RANK_PAIR2_PRI: Primary Rank of Rank Pair 2
51	RW	DDRPHY_PC_RANK_PAIR1_P1_RANK_PAIR2_PRI_V: Value in the RANK_PAIR2_PRI field is valid. If this bit is set, the RANK_PAIR1_PRI_V bit must be set in the register defined in.
52:54	RW	DDRPHY_PC_RANK_PAIR1_P1_RANK_PAIR2_SEC: Secondary Rank of Rank Pair 2
55	RW	DDRPHY_PC_RANK_PAIR1_P1_RANK_PAIR2_SEC_V: Value in the RANK_PAIR2_SEC field is valid. If this bit is set, the RANK_PAIR2_PRI_V bit must be set.
56:58	RW	DDRPHY_PC_RANK_PAIR1_P1_RANK_PAIR3_PRI: Primary Rank of Rank Pair 3

Bits	SCOM	Field Mnemonic: Description
59	RW	DDRPHY_PC_RANK_PAIR1_P1_RANK_PAIR3_PRI_V: Value in the RANK_PAIR3_PRI field is valid. If this bit is set, the RANK_PAIR2_PRI_V bit must be set.
60:62	RW	DDRPHY_PC_RANK_PAIR1_P1_RANK_PAIR3_SEC: Secondary Rank of Rank Pair 3
63	RW	DDRPHY_PC_RANK_PAIR1_P1_RANK_PAIR3_SEC_V: Value in the RANK_PAIR3_SEC field is valid. If this bit is set, the RANK_PAIR3_PRI_V bit must be set.

Register Name	***PC Periodic Base Counter 0***
Mnemonic	DPHY23.DDRPHY_PC_BASE_CNTR0_P1
Address	8001C0040301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:63	ROX	DDRPHY_PC_BASE_CNTR0_P1_PERIODIC_BASE_CNTR0: Periodic Base Counter 0. When enabled via PERIODIC_CAL_REQ_EN counter is free running (counts every dphy_nclk clock cycle). When this counter rolls over, it is reloaded with the value {PERIODIC_RELOAD_VALUE0 & '0'} from the register described in.

Register Name	***PC Periodic Reload Value 0***
Mnemonic	DPHY23.DDRPHY_PC_RELOAD_VALUE0_P1
Address	8001C0050301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_PC_RELOAD_VALUE0_P1_PERIODIC_CAL_REQ_EN: '1'b - Enable Periodic Calibration request generation from the PHY. '0'b - Disable Periodic Calibration request generation from the PHY.
49:63	RW	DDRPHY_PC_RELOAD_VALUE0_P1_PERIODIC_RELOAD_VALUE0: Periodic Reload Value 0. This value is loaded into bits 0 through 14 of the when it rolls over. Bit 15 is always loaded with '0'b when it rolls over. When this field is written to zero and the PERIODIC_CAL_REQ_EN is set to '1'b, exactly one periodic calibration (MEMCTLCPURO) is requested by the DDR PHY core.

Register Name	***PC Periodic Base Counter 1***
Mnemonic	DPHY23.DDRPHY_PC_BASE_CNTR1_P1
Address	8001C0060301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	ROX	DDRPHY_PC_BASE_CNTR1_P1_PERIODIC_BASE_CNTR1: Periodic Base Counter 1. This counter is enabled for 1 dphy_nclk clock cycle (1 count) each time the performs one counting sequence. When this counter rolls over and the FAST_SIM_PER_CNTR bit is not set it is reloaded with the value 'FFFF'h. This register enables the and the every (216 -1) x ((PERIODIC_RELOAD_VALUE0 x 2) + 1) dphy_nclk clock cycles. When this counter rolls over and the FAST_SIM_PER_CNTR bit is set it is reloaded with the value '00FF'h. When the FAST_SIM_PER_CNTR bit is set this register enables and the every (28 -1) x ((PERIODIC_RELOAD_VALUE0 x 2) + 1) dphy_nclk clock cycles.

Register Name	*PC Periodic Calibration Timer*
Mnemonic	DPHY23.DDRPHY_PC_CAL_TIMER_P1
Address	8001C0070301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:63	ROX	DDRPHY_PC_CAL_TIMER_P1_PERIODIC_CAL_TIMER: Periodic Calibration Timer. This counter is enabled for 1 dphy_nclk clock cycle (1 count) each time the performs one counting sequence. When this counter rolls over, it is reloaded with the value PERIODIC_TIMER_RELOAD_VALUE from the register described in. This register requests a periodic calibration (MEMCTLCPURO) every (216 - 1) x ((PERIODIC_RELOAD_VALUE0 x 2) + 1) x (PERIODIC_TIMER_RELOAD_VALUE - 1) dphy_nclk clock cycles. When the FAST_SIM_PER_CNTR bit is set this register requests a periodic calibration (MEMCTLCPURO) every (28 - 1) x ((PERIODIC_RELOAD_VALUE0 x 2) + 1) x (PERIODIC_TIMER_RELOAD_VALUE - 1) dphy_nclk clock cycles.

Register Name	*PC Periodic Calibration Timer Reload Value*
Mnemonic	DPHY23.DDRPHY_PC_CAL_TIMER_RELOAD_VALUE_P1
Address	8001C0080301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:63	RW	DDRPHY_PC_CAL_TIMER_RELOAD_VALUE_P1_PERIODIC_TIMER_RELOAD_VALUE: Periodic Reload Value 0. This value is loaded into the when it rolls over. This register must be set to a value greater than or equal to 2.

Register Name	*PC Periodic Impedance Calibration Timer*
Mnemonic	DPHY23.DDRPHY_PC_ZCAL_TIMER_P1
Address	8001C0090301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48:63	ROX	DDRPHY_PC_ZCAL_TIMER_P1_PERIODIC_ZCAL_TIMER: Periodic Impedance Calibration Timer. This counter is enabled for 1 dphy_nclk clock cycle (1 count) each time the performs one counting sequence. When this counter rolls over, it is reloaded with the value PERIODIC_ZCAL_TIMER_RELOAD_VALUE from the register described in. This register requests a periodic impedance calibration (ZCNTLCPURO) every (216 - 1) x ((PERIODIC_RELOAD_VALUE0 x 2) + 1) x (PERIODIC_ZCAL_TIMER_RELOAD_VALUE - 1) dphy_nclk clock cycles. When the FAST_SIM_PER_CNTR bit is set this register requests a periodic impedance calibration (ZCNTLCPURO) every (28 - 1) x ((PERIODIC_RELOAD_VALUE0 x 2) + 1) x (PERIODIC_ZCAL_TIMER_RELOAD_VALUE - 1) dphy_nclk clock cycles.

Register Name	*PC Periodic Impedance Calibration Timer Reload Value*
Mnemonic	DPHY23.DDRPHY_PC_ZCAL_TIMER_RELOAD_VALUE_P1
Address	8001C00A0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:63	RW	DDRPHY_PC_ZCAL_TIMER_RELOAD_VALUE_P1_PERIODIC_TIMER_RELOAD_VALUE: Periodic Impedance Calibration Timer Reload Value. This value is loaded into the when it rolls over. The register must be set to a value greater than or equal to 2.

Register Name	*PC Periodic Calibration Configuration*
Mnemonic	DPHY23.DDRPHY_PC_PER_CAL_CONFIG_P1
Address	8001C00B0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_PER_ENA_RANK_PAIR: '1'b indicates periodic calibration is enabled '0'b indicates periodic calibration is disabled Bit 0 contains the enable bit for rank pair 0Bit 1 contains the enable bit for rank pair 1Bit 2 contains the enable bit for rank pair 2Bit 3 contains the enable bit for rank pair 3
52	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_PER_ENA_ZCAL: Enables the periodic impedance calibration logic.
53	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_PER_ENA_SYSCLK_ALIGN: Enables the periodic alignment of the internal SysClk with the Memory Controller Clock (dphy_nclkSysClk Alignment).
54	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_ENA_PER_READ_CTR: '1'b - Enable the updating of the registers described in during periodic read centering. '0'b - Prevent the updating of the registers described in during periodic read centering.
55	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_ENA_PER_RDCLK_ALIGN: '1'b - Enable the updating of the register described in at the conclusion of periodic read centering on a nibble of DQ lanes. '0'b - Prevent the updating of the register described in at the conclusion of periodic read centering on a nibble of DQ lanes.
56	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_ENA_PER_DQS_ALIGN: Enables periodic alignment of the DQS (read) strobes from memory to the internally generated DQS strobes (DQS Alignment).
57:58	RWX	DDRPHY_PC_PER_CAL_CONFIG_P1_PER_NEXT_RANK_PAIR: Indicates which rank pair is scheduled for the next periodic calibration operation. This field is updated by the PHY as it sequences through periodic calibrations on each enabled rank pair. This field must equal one of the rank pair numbers enabled in the PER_ENA_RANK_PAIR field when at least one rank pair is enabled in the PER_ENA_RANK_PAIR field.

Bits	SCOM	Field Mnemonic: Description
59	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_FAST_SIM_PER_CNTR: This bit must be '0'b in hardware. This bit is a method for behavioral simulations to reduce the time between periodic calibrations. '1'b causes the register described in to roll over to '00FF'h. '0'b has no effect on the behavior of the register described in.
60	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_START_INIT_CAL: When this bit is written to '1'b, the DDR PHY initiates an initial calibration for all ranks enabled in the register defined in. When this bit is written to '0'b, no action is taken by the DDR PHY. When read, this bit always returns the last value written.
61	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_START_PER_CAL: When this bit is written to '1'b, the DDR PHY initiates a single periodic calibration (equivalent to a periodic timer pop). When this bit is written to '0'b, no action is taken by the DDR PHY. When read, this bit always returns the last value written.
62	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_ABORT_ON_ERR_EN: Periodic Calibration Abort on Error Enable. '1'b - Enable the detection of the pc_errn_in. '0'b - Disable the detection of the pc_errn_in.
63	RW	DDRPHY_PC_PER_CAL_CONFIG_P1_ZCAL_UPDATE_MODE: Reserved. See PC Config 0 ZCAL_NOT_CONT bit.

Register Name	***PC Configuration 0***
Mnemonic	DPHY23.DDRPHY_PC_CONFIG0_P1
Address	8001C00C0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_PC_CONFIG0_P1_PROTOCOL: Values: DDR3=>0b0000 DDR4=>0b0001 RLDRAM2_CIO=>0b0010
52	RW	DDRPHY_PC_CONFIG0_P1_DATA_MUX4_1MODE: Data Multiplexer Mode 4:1 Enable. '0'b - Data Multiplexer Mode is 2:1. The Memory Controller Interface Clock, MEMCTLCLKI, frequency is equal to the Memory Device Clock, MEMINTCLKO, frequency. Data and control signals (pins) on the Memory Controller Interface (MEMCTL Interface) is two times as wide as the data and control signals (pins) on the Memory Interface (MEMINT) Interface. '1'b - Data Multiplexer Mode is 4:1. The Memory Controller Interface Clock, MEMCTLCLKI, frequency is equal to one half of the Memory Device Clock, MEMINTCLKO, frequency. Data and control signals (pins) on the Memory Controller Interface (MEMCTL Interface) are four times as wide as the data and control signals (pins) on the Memory Interface (MEMINT Interface).
53	RW	DDRPHY_PC_CONFIG0_P1_SPAM_EN: '1'b - The PC only snoops read and write commands for primary ranks of each rank pair (that is, reads and writes to secondary ranks are ignored). '0'b - Split Access Mode is not enabled.
54	RW	DDRPHY_PC_CONFIG0_P1_DDR4_CMD_SIG_REDUCTION: Values: DDR3=>0b0 DDR4=>0b1
55	RW	DDRPHY_PC_CONFIG0_P1_SYSCLK_2X_MEMINTCLKO: Always write this bit to '0'b. This function is not supported. '0'b - The internal SysClk frequency equals the MEMINTCLKO (memory interface clock) frequency. '1'b - The internal SysClk frequency is 2* the MEMINTCLKO (memory interface clock) frequency. Support of this function requires this register to be written during the reset sequence when the PLL values are configured.
56	RW	DDRPHY_PC_CONFIG0_P1_RANK_OVERRIDE: Rank Override Mode '0'b - The DDR PHY uses the rank number (chip select) provided by the Memory Controller on the MEMCTL Interface to determine the rank pair and hence the configuration registers for each read or write command. '1'b - The DDR PHY uses the rank number provided in the RANK_OVERRIDE_VALUE field of this register to determine the rank pair and hence the configuration registers for all readwrite commands regardless of the rank number (chip select) provided by the Memory Controller on the MEMCTL Interface. When this bit is '1'b, the following assumptions/restrictions apply:

Bits	SCOM	Field Mnemonic: Description
57:59	RW	DDRPHY_PC_CONFIG0_P1_RANK_OVERRIDE_VALUE: Rank Override Value
60	RW	DDRPHY_PC_CONFIG0_P1_LOW_LATENCY: '1'b - Force Early Read Start Mode (ERS Mode) off. '0'b - ERS Mode on/off determined by CL value. When CL = 5 or 6, ERS Mode is automatically off. Otherwise, ERS Mode is automatically on.
61	RW	
62	RW	DDRPHY_PC_CONFIG0_P1_DDR4_VLEVEL_BANK_GROUP: In DDR4: '1'b - enable Voltage Level and Bank Group Arch(DDR4 ballot 1716.23). '0'b - disable Voltage Level and Bank Group Arch. For all other protocols, this bit must be '0'b.
63	RW	DDRPHY_PC_CONFIG0_P1_ZCAL_NOT_CONT: '1'b - IO PVT values are only updated when an internal ZQ cal is requested. '0'b - IO PVT values are updated continuously.

Register Name	*PC Configuration 1*
Mnemonic	DPHY23.DDRPHY_PC_CONFIG1_P1
Address	8001C00D0301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_PC_CONFIG1_P1_WRITE_LATENCY_OFFSET: Write Latency Offset (WLO) is used to adjust the delay through the internal write command FIFO. This might be necessary to accommodate additional pipelining latches in the command path. For example, RDIMM support requires this field to be set to 1 when no other additional pipeline latches are added. This value is twos compliment, with a range of '-8'd to '7'd memory clock cycles. If pipeline stages are added in the DDR PHY, the number of pipeline stages in the addrcmd path must equal the number of pipeline states in the data path.
52:55	RW	DDRPHY_PC_CONFIG1_P1_READ_LATENCY_OFFSET: Read Latency Offset (RLO) is used to adjust the delay through the internal read command FIFO. This might be necessary to accommodate additional pipelining latches in the command path. For example, RDIMM support requires this field to be set to 1 when no other additional pipelining latches are added. This value is two's compliment, with a range of '-8'd to '7'd memory clock cycles. If pipeline stages are added in the DDR PHY, the number of pipeline stages in the addrcmd path must equal the number of pipeline states in the data path. The value for this field must be: RLO less than equal min{RoundDown(System_Delay)} System_Delay and min{RoundDown(System_Delay)} is defined in the GLOBAL_PHY_OFFSET field description.
56	RW	DDRPHY_PC_CONFIG1_P1_MEMCTL_CIC_FAST: '0'b - memctl_cic_o is deasserted ('0'b) in response to memctl_cis_i being asserted ('1'b) and remains deasserted until the calibration completes. '1'b - memctl_cic_o is deasserted ('0'b) in response to memctl_cis_i being asserted ('1'b) and is asserted ('1'b) in response to memctl_cis_i being deasserted ('0'b).
57	RW	DDRPHY_PC_CONFIG1_P1_MEMCTL_CTRN_IGNORE: '0'b - DDR PHY responds to the memctl_ctrn_i input. '1'b - DDR PHY does not respond to the memctl_ctrn_i input. The memctl_ctrn_i input value is a 'don't care'.
58	RW	DDRPHY_PC_CONFIG1_P1_DISABLE_MEMCTL_CAL: Reserved. This bit must be '0'b. When set to '1'b, the DFI request ack handshaking is disabled. The DDR PHY does not wait for an ACK. This is a debug aid.
59:61	RW	DDRPHY_PC_CONFIG1_P1_MEMORY_TYPE: '001'b - DDR3 RDIMM '011'b - DDR3 LRDIMM '101'b - DDR4 RDIMM '111'b - DDR4 LRDIMM Other values are reserved.
62	RW	DDRPHY_PC_CONFIG1_P1_DDR4_LATENCY_SW: DDR4 Latency Debug Switch. Should be '1'b for normal operation.
63	RW	DDRPHY_PC_CONFIG1_P1_RETRAIN_PERCAL_SW: Retrain Percal Debug Switch. Affects behavior of memctl_cup_o during periodic read calibrations. '0'b - rank is requested rank and may not be the rank that was executed. '1'b - rank is next rank that requires calibration.

Register Name	*PC Resets*
Mnemonic	DPHY23.DDRPHY_PC_RESETS_P1

Register Name	*PC Initial Calibration Config0*
Mnemonic	DPHY23.DDRPHY_PC_INIT_CAL_CONFIG0_P1
Address	8001C0160301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000
48	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_WR_LEVEL: Enable Write Leveling during initial calibration
49	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_INITIAL_PAT_WR: Enable Initial Pattern Write during initial calibration. This bit must be set when performing Read Centering or Write Centering on memory devices that do not generate an MPR pattern. This bit must be set when performing Custom Read Centering or Custom Write Centering. If Custom Read Centering or Custom Write Centering was performed, an Initial Pattern Write of '5555' hex, the reset value of the SEQ Read/Write Data0-1 registers, must be performed before any periodic calibration routines are performed.
50	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_DQS_ALIGN: Enable DQS (read) alignment during initial calibration.
51	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_RDCLK_ALIGN: Enable the alignment of the internal SysClk to the Read clock during initial calibration. This calibration step requires the DQS (read) Alignment calibration step to have been performed.
52	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_READ_CTR: Enable Read Centering during initial calibration. This calibration step requires the SysClk to Read Clock alignment to have been performed.
53	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_WRITE_CTR: Enable Write Centering during initial calibration. This calibration step requires the Read Centering calibration step to have been performed.
54	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_INITIAL_COARSE_WR: Enable Initial Coarse Pattern Write during initial calibration. This calibration step requires the Write Centering calibration step to have been performed.
55	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_COARSE_RD: Enable Coarse Read Centering during initial calibration. This calibration step requires the Initial Coarse Pattern Write calibration step to have been performed.
56	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_CUSTOM_RD: Enable the use of a custom read pattern during initial calibration. This algorithm is not required to be run to calibrate the PHY. If it is run, it must be performed after the Coarse Read Algorithm has been run. When this bit is set, bit 1 must be set and bits 0, 2,3,4,5,6,7 must be reset. This bit is reserved. It must be written to zero for correct operation
57	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_CUSTOM_WR: Enable the use of a custom write pattern during initial calibration. This algorithm is not required to be run to calibrate the PHY. If it is run, it must be performed after the Coarse Read Algorithm has been run. When this bit is set, bit 1 must be set and bits 0,2,3,4,5,6,7 must be reset. This bit is reserved. It must be written to zero for correct operation.

Bits	SCOM	Field Mnemonic: Description
58	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ABORT_ON_CAL_ERROR: Stop the initial calibration sequence if an error occurs. If more than one calibration algorithm is enabled and an error occurs before the last calibration algorithm is started, the PHY does not perform any calibration algorithm after the errant calibration algorithm completes.
59	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_DIGITAL_EYE: Enable the internal digital eye characterization assist logic. Do not run this algorithm during normal calibration.
60:63	RW	DDRPHY_PC_INIT_CAL_CONFIG0_P1_ENA_RANK_PAIR: Enable Rank Pair ('1'b = Enabled, '0'b = disabled) Bit 12 contains the enable for rank pair 0.Bit 13 contains the enable for rank pair 1.Bit 14 contains the enable for rank pair 2.Bit 15 contains the enable for rank pair 3.

Register Name	***PC Initial Calibration Config1***
Mnemonic	DPHY23.DDRPHY_PC_INIT_CAL_CONFIG1_P1
Address	8001C0170301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000
48:51	RW	DDRPHY_PC_INIT_CAL_CONFIG1_P1_REFRESH_COUNT: Refresh count specifies the number of refresh commands to insert at the start of an initial calibration. The value zero causes no refresh commands to be sent when an initial calibration begins.
52:53	RW	DDRPHY_PC_INIT_CAL_CONFIG1_P1_REFRESH_CONTROL: This field is used to control the refresh logic during initial calibration: '00'b: Refresh commands are only sent at start of initial calibration, based on the value in the REFRESH_COUNT field. '01'b: Use the internal Refresh Interval timer to determine when refresh commands are sent; allow refreshes to occur between calibration routines. '10'b: Reserved '11'b: Use the internal Refresh Interval timer to determine when refresh commands should be sent; in addition to allowing refreshes commands to be issued between calibration routines, also allow refreshes to interrupt each calibration routine (as required). This is the recommended setting when refreshes are required during initial calibration.
54	RW	DDRPHY_PC_INIT_CAL_CONFIG1_P1_REFRESH_ALL_RANKS: '1'b Indicates that all ranks should be refreshed during initial calibration. When a refresh is generated by the DDR PHY all of the chip selects are asserted at the same time during one refresh command. '0'b indicates only the rank currently being calibrated should be refreshed. When a refresh is generated by the DDR PHY, only the chip select of the rank being calibrated are asserted during the refresh command.
55:56	RW	
57:63	RW	DDRPHY_PC_INIT_CAL_CONFIG1_P1_REFRESH_INTERVAL: Refresh Interval - This value times 256 is the number of MEMINTCLKO cycles to wait between sending refresh commands to the memory (tREFI). This value is used when the REFRESH_CONTROL field is configured to use the internal refresh interval timer. 0000001 (min. value) = 256 MEMINTCLKO cycles between refreshes 1111111 (max value) = 32512 MEMINTCLKO cycle between refreshes For example, for a DDR:1600 system running with an 800 MHz memory controller clock frequency, the value 24 ('0011000'b) provides a tREFI setting of 7.68 us (that is, 24 x 256 cycles x 1.25 ns period yields = 7.68 us).The minimum value for this field is 6. If a value less than 6 is written to this field, this field will be set to 6 by hardware. When the Refresh Interval counter expires, an internal pending refresh counter is incremented to count the number of pending refreshes. When refresh commands are issued during initial calibration, all pending refreshes will be issued and the internal counter will be decremented to zero. The internal pending refresh counter is a 4 bit counter with a maximum value of '15'd. An error bit will be set in the register if the internal pending refresh counter overflows.

Register Name	*SEQ Configuration 0*
Mnemonic	DPHY23.DDRPHY_SEQ_CONFIG0_P1
Address	8001C4020301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RW	DDRPHY_SEQ_CONFIG0_P1_MPR_PATTERN_BIT: Read and write calibration algorithms are based on eight-beat bursts. This register controls the readwrite burst data pattern. For Write data: The MPR_PATTERN_BIT value is available on all bit lanes of beat 1, 3, 5 and 7 and the inverse of the MPR_PATTERN_BIT on all bit lanes of beat 2, 3, 6 and 8, ensuring all bit lanes toggle consecutive beats. If the protocol requires a burst length longer than eight beats, the pattern in this register is repeated until all data beats are defined. For Read data: Bit 0 is brought out as output of Sequencer and DP18 composes the expected pattern from this output.
49	RW	DDRPHY_SEQ_CONFIG0_P1_TWO_CYCLE_ADDR_EN: DDR3 and DDR4: '1'b - During calibrations, the address and command are driven onto the address/cmd bus for two memory clock cycles while the appropriate chip selects are active only during the second memory clock cycle of the command. '0'b - During calibration, the address and command and chip selects are driven and active for one memory clock cycle. All other protocols: This bit must be set to '0'b. The address and command and chip selects are driven active for one memory clock cycle.
50:53	RW	DDRPHY_SEQ_CONFIG0_P1_MR_MASK_EN: Mode Register mask enable. This register masks, or disables, the mode register access by the calibration algorithms. Bits 0- 3 map to mode register 0 - 3.
54	RW	DDRPHY_SEQ_CONFIG0_P1_DELAYED_PAR: '0'b - DDR4 PAR signal is generated coincident with addresscommand signals during init cal '1'b - DDR4 PAR signal is generated one clock cycle later than addresscommand signals during init cal Bit applies to DDR4 only and is don't care for DDR3
55	RW	DDRPHY_SEQ_CONFIG0_P1_LRDIMM_CONTEXT: Value of context bit to be used during F[0]RC12 LRDIMM Control Word commands.
56	RW	DDRPHY_SEQ_CONFIG0_P1_FORCE_RESERVED: '0'b - When the PROTOCOL field in the register described in equals DDR4, Custom Read Centering and Initial Pattern Write will use the DDR4 MPR registers. '1'b - When the PROTOCOL field in the register described in equals DDR4, Custom Read Centering and Initial Pattern Write will use the Reserved Location in memory. If the PROTOCOL field in the register described in does not equal DDR4, this bit is not used and is a 'don't care'.
57	RW	DDRPHY_SEQ_CONFIG0_P1_HALT_ROTATION: '0'b - When the PROTOCOL field in the register described in equals DDR4, Custom Read Centering and Initial Pattern Write will rotate through the use of all 4 MPR registers by changing BA[0:1] during the calibration. '1'b - When the PROTOCOL field in the register described in equals DDR4, Custom Read Centering and Initial Pattern Write will set BA[0:1] = '00'b. The same 8 beats will be read repeatedly on a particular DQ lane and the expect data will not be rotated through the 4 bytes of the register every 8 beats. If the PROTOCOL field in the register described in does not equal DDR4, this bit is not used and is a 'don't care'.
58	RW	DDRPHY_SEQ_CONFIG0_P1_FORCE_MPR: '0'b - When the PROTOCOL field in the register described in equals DDR3, Custom Read Centering and Initial Pattern Write will use the Reserved Location in memory, allowing a custom 8 bit repeating pattern to be compared during read centering. '1'b - When the PROTOCOL field in the register described in equals DDR3, Custom Read Centering and Initial Pattern Write will use 4 DRAM MPR registers, allowing Custom Read Centering to read the 4 MPR registers. This is not a mode described by the DDR3 JEDEC standard. If the PROTOCOL field in the register described in does not equal DDR3, this bit is not used and is a 'don't care'.

Bits	SCOM	Field Mnemonic: Description
48:51	RW	DDRPHY_SEQ_MEM_TIMING_PARAM2_P1_TODTLON_OFF_CYCLES: For DDR3 and DDR4: max(ODTLon, ODTLoff) When the ODT values change during a calibration algorithm, the PHY waits TODTLON_OFF_CYCLES ^ 2 memory clock cycles before changing the ODT values. The ODT values might change because of a rank change or a change from read ODT values to write ODT values, or because an MRS command is issued. The ODT pins must be forced to zero during MRS commands when RTT_Nom is enabled via MR1. This is independent of the values stored in the SEQ ODT Write/Read Configuration {0-3} registers. Before issuing the MRS command, the DDR PHY checks if the ODT pin was recently changed within the window and waits for the tODTLOFF cycles to expire. When tODTLOFF expires, the ODT value is forced to zero and the DDR PHY again waits for tODTLOFF cycles. After this, the MRS command is issued and the DDR PHY waits for tMOD cycles and then restores the ODT pins to their prior state. For RLD2 and RLD3: reserved

0:47	RO	constant=0b00000000000000000000000000000000000000000000
48:55	RW	DDRPHY_SEQ_ODT_DEFAULT_CFG_P1_ODT_DEF_VALUES: The eight ODT values in this register are driven to the ODT pins during MRS commands. Typically the PDT value should be set to 0 during MRS commands. However if the ODT is an ODTCID function pin, then the corresponding bit in this register should be set to the desired CID value, and the corresponding bits in the ODT Write and Read Configuration registers should be set to similar values. Where: bit 0 - ODT value for ODT pin 0 during MRS command bit 1 - ODT value for ODT pin 1 during MRS command bit 2 - ODT value for ODT pin 2 during MRS command ... bit 7 - ODT value for ODT pin 7 during MRS command
56:63	RW	

Register Name	***RC Configuration 0***
Mnemonic	DPHY23.DDRPHY_RC_CONFIG0_P1
Address	8001C8000301183F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b00000000000000000000000000000000000000000000000000000000
48:51	RW	DDRPHY_RC_CONFIG0_P1_GLOBAL_PHY_OFFSET: Global PHY Offset, GPO. This field is the number of memory clock cycles added to the total read latency in the PHY. Minimum Value: When ADVANCE_RD_VALID = '0'b, the minimum value for this field is 5 + max{RoundUp(System_Delay)} - RLO. When ADVANCE_RD_VALID = '1'b, the minimum value for this field is 6 + max{RoundUp(System_Delay)} - RLO. When SPAM_EN = '1'b the minimum value calculated for this field is increased by 1. Where: System_Delay is the round-trip delay in the memory system: System_Delay = (((ADR_DELAY - '64'd) + {wire delay from the PHY memory clock output to the DRAM module converted to units of 1128th of a MEMINTCLKO clock cycle} + {delay of DQS at the memory module pin relative to memory clock at the memory module pin introduced by the memory module (that is, tDQSCK) converted to units of 1128th of a MEMINTCLKO clock cycle} + {wire delay from the DRAM DQS output to the PHY converted to units of 1128th of a MEMINTCLKO clock cycle}) 128) + {number of pipeline stages in the addrcmd path} + {number of pipeline stages in the read data path} max{RoundUp(System_Delay)} is the largest System_Delay in the memory system across all data bits and all ranks rounded up to the next integer memory clock cycle period value. min{RoundDown(System_Delay)} is the smallest System_Delay in the memory system across all data bits and all ranks rounded down to the next integer memory clock cycle period value. RLO is the READ_LATENCY_OFFSET field. Maximum Value: In 2:1 mode, the maximum value for this field is 'B'h. In 4:1 mode, the maximum value for this field is 'D'h.
52	RW	DDRPHY_RC_CONFIG0_P1_ADVANCE_RD_VALID: Number of MEMCTLCLKI clock cycles MEMCTLCRDVO and MEMCTLCRDVBO, when applicable, are asserted before the associated read data. '0'b - The MEMCTLCRDVO and MEMCTLCRDVBO, when applicable, are asserted during the same MEMCTLCLKI clock cycle the associated read data is valid. '1'b - The MEMCTLCRDVO and MEMCTLCRDVBO, when applicable, are asserted one MEMCTLCLKI clock cycle before the associated read data is valid. In 4:1 Data Multiplexer mode, this field must be '0'b.
53	RW	DDRPHY_RC_CONFIG0_P1_PER_DUTY_CYCLE_SW: Set to '0' for normal function. Read commands are generated during periodic cal with a 50% duty cycle. When set to '1', periodic cal issues read commands continuously.
54:56	RW	DDRPHY_RC_CONFIG0_P1_PER_REPEAT_COUNT: If this field is 000 then the number of additional periodic cals performed per request is zero. A nonzero value in this field will preform additional periodic calibrations for each request per below: 000 is No additional periodic cal iterations are performed per request. 001 is One additional periodic cal iteration is performed per request. 010 is Two additional periodic cal iterations are performed per request. .... 111 is Seven additional periodic cal iterations are performed per request.
57	RW	DDRPHY_RC_CONFIG0_P1_SINGLE_BIT_MPR_RP0: '1'b - Single bit MPR pattern memory devices in Rank Pair 0. '0'b - All bit MPR pattern memory devices in Rank Pair 0.
58	RW	DDRPHY_RC_CONFIG0_P1_SINGLE_BIT_MPR_RP1: '1'b - Single bit MPR pattern memory devices in Rank Pair 1. '0'b - All bit MPR pattern memory devices in Rank Pair 1.
59	RW	DDRPHY_RC_CONFIG0_P1_SINGLE_BIT_MPR_RP2: '1'b - Single bit MPR pattern memory devices in Rank Pair 2. '0'b - All bit MPR pattern memory devices in Rank Pair 2.
60	RW	DDRPHY_RC_CONFIG0_P1_SINGLE_BIT_MPR_RP3: '1'b - Single bit MPR pattern memory devices in Rank Pair 3. '0'b - All bit MPR pattern memory devices in Rank Pair 3.
61	RW	DDRPHY_RC_CONFIG0_P1_ALIGN_ON_EVEN_CYCLES: This bit is only valid in 4:1 Data Multiplexer Mode. In 2:1 Data Multiplexer Mode it must be '0'b. When set, latency is added, if required, to have the read data returned on the MEMCTL Interface with the first four beats of read data returned in the same dphy_nclk cycle on the R, F, RX, and FX pins. '1'b = The first beat of a read data burst is always returned on the R pin, second beat on the F pin, third beat on the RX pin, and fourth beat on the FX pin. '0'b = The first beat of a read data burst may be returned on the R or RX pin, second beat on the F or FX pin, third beat on the RX or R pin, and fourth beat on the FX or F pin. This bit must be '0'b when a burst length that is not a multiple of four is used.

Bits	SCOM	Field Mnemonic: Description
62	RW	DDRPHY_RC_CONFIG0_P1_PERFORM_RDCLK_ALIGN: This bit must be set to '1'b in hardware. This bit is a method for behavioral simulations to skip the calibration step described in. '1'b - The calibration described in must be performed for correct operation. '0'b - In a zero wire delay behavioral simulation, the RTL ignores the register settings associated with SysClkRdClk Alignment. Values in the register described in have no effect. The calibration described in fails if it is run.
63	RW	DDRPHY_RC_CONFIG0_P1_STAGGERED_PATTERN: '0'b - A[12:11], MPR Read Format, of the MR3 register in DDR4 memory modules will be set to Serial mode by the DDR PHY during Custom Read Centering. '1'b - A[12:11], MPR Read Format, of the MR3 register in DDR4 memory modules will be set to Staggered mode by the DDR PHY during Custom Read Centering.

48:53	RWX_WCLRREG	PHY23_DDRPHY_FIR_WOF_REG_DDR0_FIR_WOF: WOF Register locks on first error
54:55	RO	constant=0b00
56:60	RWX_WCLRREG	PHY23_DDRPHY_FIR_WOF_REG_DDR1_FIR_WOF: WOF Register locks on first error
61:63	RO	constant=0b000

8. Glossary

ABIST	Array built-in self test
AC	Alternating current
ACK	Acknowledgment or acknowledge
AMux	Analog multiplexer
AND write	Current register content is ANDed with write data and the result is stored in the register (access type WO_AND / WOX_AND).
ARE	Address error
ARY	Array
ATPG	Advanced test pattern generator
AVP	Architectural verification program
BCDE	Block copy download engine
BCUE	Block copy upload engine
BI	Burn in
BNDY	Boundary I/Os
BYPASSN	Bypass low active
CC	Congruence class
cmd	Command
cMFSI	Cascade master FSI
CMSK	LBIST channel mask
CP	Chip pump

CPS	Cycle-per-step
CRC	Cyclic-redundancy check
DCM	Dual-chip module
diag	Diagnostic
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
DSMP	Distributed symmetric multiprocessing
ECC	Error correction code
eDRAM	Embedded dynamic random-access memory
EH	Exclusive access hint
FARR	Fast array unload
fb	Feedback
fbclk	Feedback clock
FIFO	First-in, first-out
FIR	Fault isolation register
fmax	Maximum frequency
fmin	Minimum frequency
FSI	Flexible service interface. FSI covers all resources except FSI slave 0 and slave 1, when addressed from an external service element via the FSI interface.
FSI_BYTE	Flexible service interface byte. FSI_BYTE describes a special byte addressing mode of the FSP.
FSI0	Flexible service interface 0. FSI0 covers resources located in FSI slave 0, when

	addressed from an external service element via the FSI interface.
FSI1	Flexible service interface 1. FSI0 covers resources located in FSI slave 1, when addressed from an external service element via the FSI interface.
FSM	Finite state machine
Full write	Current register content is replaced by new write data (access type RWX).
func	Functional
GB	Gigabyte
GPIO	General-purpose input/output
GPR	General-purpose register
GPTR	General-purpose test register
HCA	Hot/cold affinity
I2C	Inter-integrated circuit
I2CM	Inter-integrated circuit master
I2CS	Inter-integrated circuit slave
ICP	Interrupt control presenter
IF	Interface
INTP	Interrupt presenter
LBIST	Logical built-in self test
LCB	Log-on control block or local clock buffer
LPC	Low pin count, lowest point of coherency
MC	Memory channel, memory controller
MCD	Memory coherency directory

MFSI	Master FSI
MISR	Multiple input shift register
MSB	Most-significant byte
NACK	Negative acknowledgment
NC	Not connected; that is, the data cannot be written or read by that access.
NCX	Same as NC, but unstable (can be changed functionally)
NOP	No operation
NX	Nest accelerator
OCC	On-chip controller
OCI	On-chip-controller interface. Interface used by power management.
OPB	On-chip peripheral bus
OPCG	On-product clock generator
OR write	Current register content is ORed with write data and the result is stored in the register (access type WO_OR / WOX_OR).
OSC	Oscillator
OSCSW	Oscillator switch
OTPROM	One-time programmable read-only memory
PB	Processor bus
Pb	Lead
PBA	Power management processor bus interface
PCB	Pervasive control bus. PCB is used for read and full write access.
PCB1	Pervasive control bus 1. PCB1 is used for AND write access.

PCB2	Pervasive control bus 2. PCB2 is used for OR write access.
PCBIF	Pervasive control bus interface
PCI	Peripheral Component Interface
PCIe	Peripheral Component Interface Express
PCIEX	Peripheral Component Interface Express
PCLK	Processor clock
PERV	Pervasive
PIB	Pervasive interconnect bus. PIB is used for read and full write access.
PIB1	Pervasive interconnect bus. PIB1 is used for AND write access.
PIB2	Pervasive interconnect bus. PIB2 is used for OR write access.
PLL	Phase-locked loop
PLLREG	Phase-locked loop register
PMC	Performance monitor counter, power management control
PRPG	Pseudo-random pattern generator
PSI	Processor support interface
PSRO	Performance sort-ring oscillator
RDDACK	Read acknowledgment
RDIV	Refclk divide
Refclk	Reference clock
REGF	Register file
REPR	Array repair

RO	Read only. Only used if a bit is tied. Status bits should be ROX.
ROM	Read-only memory
ROX	Same as RO, but unstable. Can be changed functionally.
ROX_CLRPART	Same as ROX, but a read access will clear the bits after they have been accessed.
RW	Readable and writable
RW_WAND	Readable and writable. A write ANDs written data with existing data and stores the result.
RW_WCLEAR	Readable and writable. A write of a ‘1’ clears the bit. A write of a ‘0’ does nothing.
RW_WCLRPART	Readable and writable. Any write to the address clears the bits regardless of value.
RW_WOR	Readable and writable. A write ORs written data with existing data and stores the result.
RW_WSETPART	Readable and writable. Any write to the address sets the bits regardless of value.
RWX	Same as RW, but unstable. Can be changed functionally.
RWX_WAND	Same as RW_WAND, but unstable. Can be changed functionally.
RWX_WCLEAR	Same as RW_WCLEAR, but unstable. Can be changed functionally.
RWX_WCLRPART	Same as RW_WCLRPART, but unstable. Can be changed functionally.
RWX_WOR	Same as RW_WOR, but unstable. Can be changed functionally.
RWX_WSETPART	Same as RW_WSETPART, but unstable. Can be changed functionally.
RX	Receive
SBE	Self-boot engine
SCM	Single-chip module
SCOM	Serial communications. SCOM is used for read and full write access.
SCOM1	Serial communications 1. SCOM1 is used for AND write access.

SCOM2	Serial communications 2. SCOM2 is used for OR write access.
SCOMFSI0	Scan communications to flexible service interface 0. SCOMFSI0 covers resources located in FSI slave 0, when addressed from the PIB.
SCOMFSI1	Scan communications to flexible service interface 1. SCOMFSI1 covers resources located in FSI slave 1, when addressed from the PIB.
SEL	Select
Slvrst	Slave reset
SPATTN	Special attention
SPR	Special-purpose register
SPRD	Special-purpose register data
SPRD_T0	Special-purpose register thread 0
SPRD_T1	Special-purpose register thread 1
SPRD_T3	Special-purpose register thread 3
SPRD_T5	Special-purpose register thread 5
SPS	Steps per sync, sleep Pstate
TFMR	Time Facility Management Register
TOD	Time of day
TX	Transmit
UE	Uncorrectable error
VCO	Voltage controlled oscillator
VIO	Voltage I/O
Vref	Voltage reference

wdata	Write data
WO	Same as RW, but bits are write-only.
WO_AND	Same as RW_WAND, but bits are write-only.
WO_CLEAR	Same as RW_WCLEAR, but bits are write-only.
WO_CLRPART	Same as RW_WCLRPART, but bits are write-only.
WO_n_mP	Write only pulsed. A write of ‘1’ creates a pulse for a minimum of n register clocks and maximum of m register clocks. A read returns ‘0’.
WO_nP Write	Only pulsed. A write of ‘1’ creates a pulse for n register clocks. A read returns ‘0’.
WO_OR	Same as RW_WOR, but bits are write-only.
WO_SETPART	Same as RW_WSETPART, but bits are write-only.
WOF	Who's on first?
WOX	Same as WO, but unstable. Can be changed functionally.
WOX_AND	Same as WO_AND, but unstable. Can be changed functionally.
WOX_CLEAR	Same as WO_CLEAR, but unstable. Can be changed functionally.
WOX_CLRPART	Same as WO_CLRPART, but unstable. Can be changed functionally.
WOX_n_mP	Same as WO_n_mP, but unstable. Can be changed functionally.
WOX_nP	Same as WO_nP, but unstable. Can be changed functionally.
WOX_OR	Same as WO_OR, but unstable. Can be changed functionally.
WOX_SETPART	Same as WO_SETPART, but unstable. Can be changed functionally.
XER	Fixed-Point Exception Register
XFIR	X Fault Isolation Register
XOR	Exclusive OR

ABIST	Array built-in self test
AC	Alternating current
ACK	Acknowledgment or acknowledge
AMux	Analog multiplexer
AND write	Current register content is ANDed with write data and the result is stored in the register (access type WO_AND / WOX_AND).
ARE	Address error
ARY	Array
ATPG	Advanced test pattern generator
AVP	Architectural verification program
BCDE	Block copy download engine
BCUE	Block copy upload engine
BI	Burn in
BNDY	Boundary I/Os
BYPASSN	Bypass low active
CC	Congruence class
cmd	Command
cMFSI	Cascade master FSI
CMSK	LBIST channel mask
CP	Chip pump
CPS	Cycle-per-step
CRC	Cyclic-redundancy check

DCM	Dual-chip module
diag	Diagnostic
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
DSMP	Distributed symmetric multiprocessing
ECC	Error correction code
eDRAM	Embedded dynamic random-access memory
EH	Exclusive access hint
FARR	Fast array unload
fb	Feedback
fbclk	Feedback clock
FIFO	First-in, first-out
FIR	Fault isolation register
fmax	Maximum frequency
fmin	Minimum frequency
FSI	Flexible service interface. FSI covers all resources except FSI slave 0 and slave 1, when addressed from an external service element via the FSI interface.
