Revision Log

Each release of this document supersedes all previously released versions. The revision log lists all significant changes made to the document since its initial release.

Version	Revision Date	Description
1.0	07/31/14	Initial Release.

About this Document

This document describes the POWER8 registers used by both the IBM® POWER8™ Memory Buffer. These registers are referred to as "POWER8" registers. Throughout this document, the term “processor” refers to the POWER8 Processor and “memory buffer” refers to the POWER8 Memory Buffer.

To ensure you have the most current version of this document, contact your IBM technical representative or visit the OpenPOWER Connect website.

Who Should Read this Document

This manual is intended for system software and hardware developers and application programmers who want to develop products for the POWER8 memory buffer. It is assumed that the reader understands operating systems, microprocessor system design, basic principles of reduced instruction set computer (RISC) processing, and details of the Power ISA.

Representation of Numbers

Numbers are generally shown in decimal format, unless designated as follows:

- Hexadecimal values are usually preceded by “0x,” or displayed inside single quotation marks and followed by an “x.”
  For example: 0x000000000204000D, or '000000000204000D'x.

- Binary values in sentences are usually preceded by “0b,” or displayed inside single quotation marks and followed by a “b.”

  For example: 0b1, or '1'b.

Note: A bit value that is immaterial, which is called a “don't care” bit, is represented by an “X” or "x."

Bit Significance

In the POWER8 documentation, the smallest bit number represents the most significant bit of a field, and the largest bit number represents the least significant bit of a field.

Organization

The table of contents provides a list register names. An address map lists the registers in alphabetical order by mnemonic (see Chapter 1 on page 160). The registers themselves are arranged by their addresses. A register can have multiple addresses with a different addresses for different units. The types of access permitted can vary by unit.

Terminolgy

For definitions of the acronyms and abbreviations used in this document, see Section 8 *Glossary*.

The memory buffer registers are listed in the following tables.

Register Name	***PLL Control Register***
Mnemonic	PLLMEM.PLL_CNTRL0
Address	0000000000000000 (PLLREG)
Attributes	
Description	

Bits	PLLREG	Field Mnemonic: Description
0:2	RO	BYPMODE: Bypass Mode Selector
3	RO	BYPASS: Enable PLL Bypass, only effective if no reset and no enables are set (that is in case of a disable, HW141963) Values: OFF=>0b1 ON=>0b0
4:5	RO	CHARMODE: Testout Divide Selector
6:8	RO	CP_TUNE: Charge Pump Tune Bits
9:11	RO	DUTY_ADJ: Adjust Duty Cycle
12	RO	FBKMODE: Used by Digital Pll
13:14	RO	IREF_TUNE: IREF Process/Temperature Tune Bits
15:34	RO	JIT_CNTL: Jitter Macro Controller
35:45	RO	LOCK_TUNE: Lock Tune Bits
46:54	RO	MULT: Multiplication Factor
55:56	RO	OUTSEL: Select Between PLLOUTA and B for TESTOUT
57:58	RO	PHASEDET_TUNE: Phase Detector Tune Bits
59	RO	FBKSEL: Select between external and internal feedback clock
60:63	RO	RANGEA: Range Selector for PLLOUTA

Register Name	***PLL Control Register***
Mnemonic	PLLMEM.PLL_CNTRL1
Address	0000000000000001 (PLLREG)
Attributes	
Description	

Bits	PLLREG	Field Mnemonic: Description
0:3	RO	RANGEB: Range Selector for PLLOUTB
4	RO	REFDIV: Ref divider select
5:6	RO	A2D_TUNE_0_TO_1: Tune bits 0 to 1 for A to D converter
7:11	RO	A2D_TUNE_2_TO_6: Tune bits 2 to 6 for A to D converter
12:17	RO	ANALOGOUT_TUNE: Tune bits for Analog out ckt
18:19	RO	VREG_TUNE: Selector for Vreg
20	RO	CTST_TUNE: Cap leakage tune bit
21	RO	LOCK_SEL: Selects which lock detector is used

Bits	PLLREG	Field Mnemonic: Description
22	RO	TST_MODE_EN: For test use only
23	RO	TSTMODE_NCAP_LT: For test use only
24	RO	TSTMODE_IREF_LT: For test use only
25	RO	TSTMODE_DT_LT: For test use only
26	RO	TSTMODE_AOUT_LT: For test use only
27	RO	TSTMODE_VCOCMP_LT: For test use only
28	RO	TSTMODE_CTST_LT: For test use only
29	RO	TSTMODE_VCO_SEL: For test use only
30	RO	CPHASE: Sel for duty mux in out_driver
31	RO	E_MODE_ENABLE: Digital PLL and Digital Testout modes
32:62	RO	TUNE: Tune bits
63	RO	OUTA_DISABLE: Disable for output a

Register Name	***PLL Control Register***
Mnemonic	PLLMEM.PLL_CNTRL2
Address	0000000000000002 (PLLREG)
Attributes	
Description	

Bits	PLLREG	Field Mnemonic: Description
0	RO	OUTB_DISABLE: Disable for output b
1:2	RO	VCODIV: VCO divider
3	RO	DIGTESTOUT: Digital test out of PLL (for test purpose)
4	RO	RESET: reset bit is not used in Analog PLL, only Filt and Tank
5:7	RO	SPARE: Not used

Register Name	*FSI Data Register 0*
Mnemonic	VI.FSI.I2_DATA_REGISTER_0
Address	0000000000002000 (FSI)
Attributes	
Description	

Bits	FSI	Field Mnemonic: Description
0:31	RWX	I2_DATA_REG_0: First 32 bits for PIB access

Register Name	*FSI Data Register 1*
Mnemonic	VI.FSI.I2_DATA_REGISTER_1
Address	0000000000002001 (FSI)
Attributes	
Description	

Bits	FSI	Field Mnemonic: Description
0:31	RWX	I2_DATA_REG_1: Second 32 bits for PIB access

Register Name	*Contains Command To The FSI2PIB Engine*
Mnemonic	VI.FSI.I2_COMMAND_REGISTER
Address	0000000000002002 (FSI)
Attributes	
Description	

Bits	FSI	Field Mnemonic: Description
0:31	RWX	I2_CMD_REG: command register

Register Name	*Resets Data,command,status Registers*
Mnemonic	VI.FSI.I2_RESET
Address	0000000000002006 (FSI)
Attributes	
Description	

Bits	FSI	Field Mnemonic: Description
0	WO	reset resets command,mode,watermark,interrupt mask,status,complement mask,true mask registers

Register Name	*Reset PIB Master IF*
Mnemonic	VI.FSI.I2_SET_PIB_RESET
Address	0000000000002007 (FSI)
Attributes	
Description	

Bits	FSI	Field Mnemonic: Description

Register Name	*INTERRUPT STATUS Register*
Mnemonic	VI.FSI.I2_INTERRUPT
Address	000000000000200B (FSI)
Attributes	
Description	

Bits	FSI	Field Mnemonic: Description
0:31	RWX	I2_INTERRUPT_STATUS_REG: Contains status information, but gets frozen when interrupt occurs

Register Name	*Complement Mask Register*
Mnemonic	VI.FSI.I2_COMPLEMENT_MASK
Address	000000000000200C (FSI)
Attributes	
Description	

Bits	FSI	Field Mnemonic: Description
0:31	RWX	I2_COMPLEMENT_MASK_REG: Complement Mask for controlling generation of interrupts

Register Name	*True Mask Register*
Mnemonic	VI.FSI.I2_TRUE_MASK
Address	000000000000200D (FSI)
Attributes	
Description	

Bits	FSI	Field Mnemonic: Description

Register Name	*Ignore Parity Register*
Mnemonic	TPTOP.PIB.PCBMS.IGNORE_PAR_REG
Address	00000000000F001C (PIB)
Attributes	
Description	If set to 1, accesses to the PCB master get forwarded to PCB, also all interrupts are forwarded to the interrupt controller. If set to 0, accesses with parity error to the PCB master do not get forwarded to the PCB, interrupt packets with parity error do not get forwarded to the interrupt controller.

Bits	PIB	Field Mnemonic: Description
0	RW	IGNORE_PARITY_REG: Set to 0 to block accesses with parity errors from PCB, also to ignore interrupt packets with parity error.
1	RW	DISABLE_ECC_CORRECTION: If set, the ECC error correction feature is off.
2	RWX_WCLRPART	ECC_S_BIT_ERROR: Set by HW on single-bit ECC error. Cleared on writing

Register Name	*Reset Register*
Mnemonic	TPTOP.PIB.PCBMS.RESET_REG
Address	00000000000F001D (PIB)
Attributes	
Description	Bit 0 resets all PCB elements outside of the standby domain, Bit 1 resets all endpoints.

Bits	PIB	Field Mnemonic: Description
0	RW	RESET_PCB: Reset all PCB elements outside of the standby domain
1	RW	RESET_ENDPOINTS: Unused: Reset all endpoints attached to the PCB. Bit now in FSI Domain.
2	RW	TIMEOUT_RESET_EN: Enable for auto-reset PCB on PCB-timeout

Register Name	*PCB Master Error Register, Contains First Error*
Mnemonic	TPTOP.PIB.PCBMS.FIRST_ERR_REG
Address	00000000000F001E (PIB)
Attributes	
Description	

Bits	PIB	Field Mnemonic: Description
0	RWX_WCLRREG	FIRST_TIMEOUT_ACTIVE: Active when master ran into timeout
1	RWX_WCLRREG	FIRST_PARITY_ERR: Parity error on internal FSMs
2	RWX_WCLRREG	FIRST_BEAT_NUM_ERR: Beat with wrong beat number received
3	RWX_WCLRREG	FIRST_BEAT_REC_ERR: Unexpected beat received
4	RWX_WCLRREG	FIRST_RECEIVED_ERROR: Error packet received
5	RWX_WCLRREG	FIRST_RX_PCB_DATA_P_ERR: Data parity on incoming packet
6	RWX_WCLRREG	FIRST_PIB_ADDR_P_ERR: Parity error on PIB address
7	RWX_WCLRREG	FIRST_PIB_DATA_P_ERR: Parity error on PIB data

Register Name	*Internal PCB Master Error Register*
Mnemonic	TPTOP.PIB.PCBMS.ERROR_REG

0:3	RW	FUNC_CAPT_COUNT: BIST mode: capture cycles (1-12) encoded as capture cycle - 1
4:43	RW	FUNC_CAPT_INSTR_F: BIST mode: functional capture Instr 0-7 f domain (sl, nsl, ary, sg, fce)
44:63	RW	FUNC_CAPT_INSTR_FBY2: BIST mode: functional capture Instr 0-3 f/2 domain (sl, nsl, ary, sg, fce)

Register Name	***OPCG Control Register 2***
Mnemonic	TPTOP.TPC.OPCG_REG2
Address	0000000001030004 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:11	RW	SCAN_COUNT: BIST mode: Channel scan count (s = 0-4095) runn-mode: start_abist match value(0:11)
12:23	RW	MISR_A_VAL: BIST mode: a value for MISR aperture, runn-mode: start_abist match value(12:23)
24:35	RW	MISR_B_VAL: BIST mode: b value for MISR aperture, runn-mode: start_abist match value(24:35)
36:47	RW	MISR_INIT_WAIT: BIST mode: delay MISR aperture, MISRs get active after this number of loops
48	RW	SCAN_CLK_USE_EVEN: BIST mode: Generate scan clock in f odd cycle. runn-mode: run one additional clock in f domain
49:51	RW	OPCG_PAD_VALUE: After setting all DC signals, wait this many number of cycle x 16 before applying tholds
52	RW	USE_F_AND_FDIV2: BIST mode: if 1, use 8 f and 4 f/2 pattern concurrently, else use 1-12 local mesh patterns
53	RW	USE_ARY_CLK_DURING_FILL: BIST mode: Fire nsl_ary_clock during NSL-fill runn-mode: stop run-n on xstop
54	RW	SG_HIGH_DURING_FILL: BIST mode: Hold SG high during NSL-fill runn-mode: OPCG engine controls start_abist (overrides GP0 setting)
55	RW	RTIM_THOLD_FORCE: force rtim_thold low when not in test_dc mode (must be 0 at all time)
56	RW	LBIST_SKITTER_CTL: BIST mode: 0: enable skitter during lbist_ip, 1: enable skitter when misr_active
57	RW	MISR_MODE: BIST mode: MISR aperture mode (0: a-1 to b-1, 1: start to a and b to end)
58	RW	INFINITE_MODE: infinite mode
59:63	RW	NSL_FILL_COUNT: BIST mode: NSL-fill count (0-31)

Register Name	***Opcg Start Register***
Mnemonic	TPTOP.TPC.OPCG_REG3
Address	0000000001030005 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RWX	OPCG_GO2: opcg go for broadcast sequences (start sequence)
1	RW	RUN_OPCG_ON_UPDATE_DR: start opcg engine when scan updated (update_dr) received (set pulse)
2	RW	RUN_OPCG_ON_CAPTURE_DR: start opcg engine when scan updated (capture_dr) received (set pulse)
3:4	RW	ALIGN_SOURCE_SELECT: 0: use inopa setting from opcg_reg0, 1: use rising edge of sync pulse, 2: use input from unit (for AVP)

Bits	PCB	Field Mnemonic: Description
5:7	RW	PRPG_WEIGHTING: prpg_activate: 1/2, 1/4, 1/8, 1/16, 1/2, 3/4, 7/8, 15/16
8:19	RWX	PRPG_VALUE: set to 0 for prpg always on, else seed
20	RW	EXTEND_INOPW_ENOPW: extend I/ENOPW: add 256 cycles if i/enop>0, else 257+max i/enop
21	RW	EXTEND_SNOPW: add 256 cycles if snop>0, else 257+max snop
22	RW	FORCE_SG_HIGH_DURING_SNOP: force sg high during snop
23:31	RW	CHKSW: reserved for debug switches (keep 0 unless chksw required)
32:43	RW	PRPG_A_VAL: a value for PRPG aperture
44:55	RW	PRPG_B_VAL: b value for PRPG aperture
56	RW	PRPG_MODE: PRPG aperture mode (0: a-1 to b-1, 1: start to a and b to end)
57:63	RW	SPARE3: spares

Description	

Bits	PCB	PCB1	PCB2	Field Mnemonic: Description
0	RWX	WOX_AND	WOX_OR	TC_UNIT_ABSTCLK_MUXSEL_DC: Select ABIST clock source for Arrays on Chiplet Boundary. When set to 1, clocks where used from Chiplet with ABIST, Reset (0b0)
1	RWX	WOX_AND	WOX_OR	TC_UNIT_SYNCCLK_MUXSEL_DC: Select the sync clock for async latches (init value 1), Reset (0b1)
2	RWX	WOX_AND	WOX_OR	TC_GPIO_FLUSHMODE_INH_DC_OUT: Prevent plats from going into flush mode (init value 1), Reset (0b1)
3	RWX	WOX_AND	WOX_OR	TC_GPIO_FORCEALIGN: Force align signal to be sent (init value 1, drop before dropping flushmode_inh), Reset (0b1)
4	RWX	WOX_AND	WOX_OR	TC_GPIO_AVP_MODE_DC_OUT: Enable AVP mode, Reset (0b0)
5	RWX	WOX_AND	WOX_OR	NOT_USED9: not used, Reset (0b0)
6	RWX	WOX_AND	WOX_OR	TC_GPIO_CC_SCAN_DIS_DC_B_OUT: Disable scan - set output of scan chain to zero, Reset (0b0)
7	RWX	WOX_AND	WOX_OR	TC_SKIT_MODE_BIST_DC: Enable Skitter measuring during Bist, Reset (0b0)
8	RWX	WOX_AND	WOX_OR	TC_GPIO_LBIST_EN_DC_OUT: LBIST mode, Reset (0b0)
9	RWX	WOX_AND	WOX_OR	TC_UNIT_LBIST_AC_MODE_DC: LBIST AC mode, Reset (0b0)
10	RWX	WOX_AND	WOX_OR	TC_UNIT_LBIST_ARY_WRT_THRU_DC: Array write-through mode - set Array in bypass mode, Reset (0b0)
11	RWX	WOX_AND	WOX_OR	TC_ABIST_MODE_DC: Set during ABIST, Reset (0b0)
12	RWX	WOX_AND	WOX_OR	TC_GPIO_ABIST_START_TEST_DC_OUT: Set to start ABIST testing, Reset (0b0)
13	RWX	WOX_AND	WOX_OR	NOT_USED0: not used, Reset (0b0)

Bits	PCB	PCB1	PCB2	Field Mnemonic: Description
14	RWX	WOX_AND	WOX_OR	TC_UNIT_ATPG_EN_DC: ATPG mode, Reset (0b0)
15	RWX	WOX_AND	WOX_OR	TC_GPIO_SCAN_PROTECT_DC_OUT: Scan protection enable (init value 1), Reset (0b1)
16	RWX	WOX_AND	WOX_OR	NOT_USED1: not used, Reset (0b1)

Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBICFGQ_FORCE_CHANNEL_FAIL: If '1' the MBI will enter the channel fail state
1	RW	MBICFGQ_REPLAY_CRC_DISABLE: If 0 EDI frames will be replayed, by the transmitter, when a frame crc error is detected. If 1 EDI frames will not be replayed, by the transmitter, when a frame crc error occurs.
2	RW	MBICFGQ_REPLAY_NOACK_DISABLE: If 0 EDI frames will be replayed, by the transmitter, when the frame does not get acknowledged when the FRTL timer expires. If 1 EDI frames will not be replayed, by the transmitter, when the frame does not get acknowledged when the FRTL timer expires.
3	RW	MBICFGQ_REPLAY_OUTOFORDER_DISABLE: If 0 EDI frames will be replayed, by the transmitter, when an out-of-order Sequence ID is detected. If 1 EDI frames will not be replayed, by the transmitter, when an out-of-order Sequence ID is detected.

Bits	SCOM	Field Mnemonic: Description
4	RWX	MBICFGQ_FORCE_LFSR_REPLAY: If 1 EDI frames are replayed from the replay buffer when an LFSR pulse is detected by the replay controller. Setting this bit will result in multiple frame replays.
5	RW	MBICFGQ_CRC_CHECK_DISABLE: If 0 EDI frames will be checked for CRC errors. If 1 EDI frames will not be checked for CRC errors.
6	RW	MBICFGQ_ECC_CHECK_DISABLE: If 0 EDI frames, from the replay buffer, will be checked for ECC errors. If 1 EDI frames, from the replay buffer, will not be checked for ECC errors.
7	RWX	MBICFGQ_FORCE_FRAME_LOCK: If 1 Force EDI frame start generation. Note: This feature is meant to be used in a standalone memory buffer debug verification environment. An attached chip will not function properly if this bit is set. Normally, this process should be initiated from the host processor.
8	RWX	MBICFGQ_FORCE_FRTL: If 1 Frame Round Trip Latency (FRTL) will be calculated. Note: This feature is meant to be used in a standalone memory buffer debug verification environment. An attached chip will not function properly if this bit is set. Normally, this process should be initiated from the host processor.
9	RW	MBICFGQ_AUTO_FRTL_DISABLE: If 0 Frame Round Trip Latency of EDI frames will automatically be generated by hardware. If 1 Disable the automatic calculation of EDI Frame Round Trip Latency by hardware. This bit should be set when the FRTL value is set manually in bits 10:16.
10:16	RW	MBICFGQ_MANUAL_FRTL_VALUE: This 7-bit value represents the Frame Round Trip Latency of the memory channel. It measures the delay from when a EDI frame is launched to when the corresponding acknowledge bit is received by the initiator. Value Delay 0000000 No Delay 0000001 1 - 2.4 GHz cycle - - - 1111110 126 - 2.4 GHz cycles 1111111 127 - 2.4 GHz cycles Note: This value is used only when bit 9 of mbicfgq is a 1. Note: Both the memory buffer and the host MC must be set up similarly in either auto or manual mode.
17	RW	MBICFGQ_MANUAL_FRTL_DONE: If 1 the manual Frame Round Trip Latency (FRTL) value has been set by software. Note: This bit must be set, when in manual FRTL mode, to complete channel initialization.
18	RW	MBICFGQ_ECC_CORRECT_DISABLE: If 0 EDI frames, from the replay buffer, will be corrected for ECC Correctable Errors. If 1 EDI frames, from the replay buffer, will not be corrected for ECC Correctable Errors.
19	RW	MBICFGQ_SPARE1: Reserved
20	RW	MBICFGQ_LANE_VOTING_BYPASS: If 0 Bad lane vote is automatically generated by hardware when a crc error is detected. If 1 Force a one shot bad lane vote. Allows firmware to bypass the hardware lane voting algorithm.

Description	

Bits	SCOM	Field Mnemonic: Description
0:7	RW	FBNCSPCR_CFG_FBN_CMD_SPC: Provides the user defined command spacing from 0 to 255 2.44 clock cycles. This is used as a mask in random mode to limit the random spacing. Each bit when set to one allows the use of that same bit to be a one during random spacing. Hence setting this field to FF allows random cmd spacing from 00-FF and setting this field to 00 allows random passing from 00 - 00.
8:15	RWX	FBNCSPCR_CFG_FBN_CMD_SPC_SEED: Provides the random seed for random command spacing mode. Must be 0x01 or higher

0:15	RW	FBNDCR_CFG_FBN_DATA_INV: Data inversion configuration is used in conjunction with the data pattern inversion bits in the fbnmr0:7 registers. Each bit from 0 through 16 determines which dw of data will be inverted. In example, if b0 is 1 then dw0 will be inverted should the data pattern inversion bit for the commands (in fbnmr0:7) is also set. This allows the used to create data traffic on certain buses that will flip every cycle, etc.

1	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_INT_PROTOCOL_ERROR: Internal logic to the MBS unit experienced a unrecoverable protocol error.

Bits	SCOM	SCOM1	SCOM2	Field Mnemonic: Description
2	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_INVALID_ADDRESS_ERROR: Address detected that does not translate to a DRAM location.
3	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_EXTERNAL_TIMEOUT: Shadow Machine has timed-out waiting on cresp on a speculative command or have not obtained write data on a write command. If there is no channel replay timeout, we can be certain the timeout is due to the host processor. If there is a replay timeout, the channel will checkstop.
4	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_INTERNAL_TIMEOUT: Shadow Machine time-out but not waiting on cresp and not waiting on data, plus a Prefetch timeout or Cleaner timeout. If there is not a replay timeout, this will indicate a problem in the memory buffer.
5	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_INT_BUFFER_CE: CE detected in Shadow Write Buffer, Prefetch buffer, or Inband Buffer
6	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_INT_BUFFER_UE: UE detected in Shadow Write Buffer, Prefetch buffer, or Inband Buffer

8	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_INT_PARITY_ERROR: A parity error was detected by MBS logic, either on an MBS interface or internal to the MBS logic
9	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_CACHE_SRW_CE: CE detected on Shadow read (read port1) Note: PRD counts the number of these within a window of time and may decide to line delete the next CE.

15	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_DIR_CE: Directory CE occurred on at least one member during a directory read. An attempt will be made to fix the single bit error.
16	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_DIR_UE: Directory UE occurred on at least one member during a directory read. NOTE: The cache will treat a Directory UE the same as CE in that it will keep trying to fix the error and therefore a timeout will eventually be reported.
17	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_DIR_MEMBER_DELETED: A directory member has been deleted. This can be HW or FW initiated. HW will delete if there is a cache UE on a cache read. FW can setup HW to delete on the next cache CE if the number of CEs exceed a threshold, but FW must monitor the maximum deleted members observed in any congruence class to ensure we do not exceed 15 members deleted in a set.
18	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_DIR_ALL_MEMBERS_DELETED: All 16 members within a particular congruence class have been deleted. This could be due to a UE in each member or PRD allowed too many line deletes on CE.
19	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_LRU_ERROR: invalid LRU value, most likely due to SRAM error. This may impact the performance of the cache, but it is a recoverable error and therefore should not cause a checkstop.
20	RWX	WOX_AND	WOX_OR	MBS_FIR_REG_EDRAM_ERROR: internal eDRAM command collision or eDRAM refresh timeout.

Register Name	***MBS Error Injection Register***
Mnemonic	MBU.MBS.MBSEINJQ
Address	000000000201140E (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBSEINJQ_CACHE_WP0_ERR_INJECT_MODE: Used to control whether the error injection is once or continuous. Note that this injection is applied to write port 0 of the cache, of which there are two write ports. The types of operations that use write port 0 include DS Writes, DS Partial Writes, and DS Read Miss allocations due to SFstat updates, while Prefetch and all other Read Miss allocations use write port 1. Note that if the cache is disabled, this will inject errors in the write data path to the MBA. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
1	RW	MBSEINJQ_CACHE_WP0_ERR_INJECT_CE: Inject a CE when writing into write port0 of the eDRAM cache.
2	RW	MBSEINJQ_CACHE_WP0_ERR_INJECT_UE: Inject a UE when writing into write port0 of the eDRAM cache.
3	RW	MBSEINJQ_CACHE_WP0_ERR_INJECT_SUE: Inject a SUE when writing into write port0 of the eDRAM cache.
4	RW	MBSEINJQ_DIRECTORY_ERR_INJECT_MODE: Used to control whether the error injection is once or continuous. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
5	RW	MBSEINJQ_DIRECTORY_ERR_INJECT_CE: Inject a CE when reading the SRAM directory.
6	RW	MBSEINJQ_DIRECTORY_ERR_INJECT_UE: Inject a UE when reading the SRAM directory.
7	RW	MBSEINJQ_SWB_ERR_INJECT_MODE: Used to control whether the error injection is once or continuous. Note this injection is applied to the data buffer that holds Downstream write data and is referred to as the Shadow Write Buffer. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
8	RW	MBSEINJQ_SWB_ERR_INJECT_CE: Inject a CE when writing into the SWB.
9	RW	MBSEINJQ_SWB_ERR_INJECT_UE: Inject a UE when writing into the SWB.
10	RW	MBSEINJQ_SRB_RP0_ERR_INJECT_MODE: Used to control whether the error injection is once or continuous. Note that this injection is applied to the read port 0 of the data buffer that holds Shadow read data, of which there are two read ports. Read Port 0 is used to transfer read data Upstream. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
11	RW	MBSEINJQ_SRB_RP0_ERR_INJECT_CE: Inject a CE when reading the SRB read port 0.
12	RW	MBSEINJQ_SRB_RP0_ERR_INJECT_UE: Inject a UE when reading the SRB read port 0.
13	RW	MBSEINJQ_SRB_RP1_ERROR_INJECT_MODE: Used to control whether the error injection is once or continuous. Note that this injection is applied to the read port 1 of the data buffer that holds Shadow read data, of which there are two read ports. Read Port 1 is used to service a read cache miss allocation, a partial write merge with SWB data, or SFstat update on a DS read. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
14	RW	MBSEINJQ_SRB_RP1_ERROR_INJECT_CE: Inject a CE when reading the SRB read port 1.
15	RW	MBSEINJQ_SRB_RP1_ERROR_INJECT_UE: Inject a UE when reading the SRB read port 1.
16	RW	MBSEINJQ_PFB_ERR_INJECT_MODE: Used to control whether the error injection is once or continuous. Note that this injection is applied to the Prefetch read data buffer, which is used to write prefetch data into the cache. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
17	RW	MBSEINJQ_PFB_ERR_INJECT_CE: Inject a CE when reading the PFB.
18	RW	MBSEINJQ_PFB_ERR_INJECT_UE: Inject a UE when reading the PFB.

Bits	SCOM	Field Mnemonic: Description
19	RW	MBSEINJQ_SPWA_ERR_INJECT_MODE: Used to control whether the error injection is once or continuous. Not that this injection is applied to the Shadow Partial Write Attributes buffer, which is used to store DS partial write command attributes such as tsize and function. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
20	RW	MBSEINJQ_SPWA_ERR_INJECT_PERR: Inject a parity error when writing the SPWA
21	RW	MBSEINJQ_CO_ERR_INJECT_MODE: Used to control whether the error injection is once or continuous. Note that this injection is applied to the cache read port 0, which is used for casting out data from the cache to MBA. The cache read port 1 is used to read data into the Shadow Read Buffer. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
22	RW	MBSEINJQ_CO_ERR_INJECT_CE: Inject a CE when performing a CO of the cache.
23	RW	MBSEINJQ_CO_ERR_INJECT_UE: Inject a UE when performing a CO of the cache.
24	RW	MBSEINJQ_INT_RESET_KEEPER: Writing this bit to a 1 will pulse the reset of the hold latches in the MBS c_err_rpt's.
25	RW	MBSEINJQ_RESERVED_25: reserved
26	RW	MBSEINJQ_RESERVED_26: reserved
27	RW	MBSEINJQ_IB_BFR_ERR_INJECT_MODE: Used to control whether the error injection is once or continuous. Note that this injection is applied to the inband read/write buffer. Values: ONE_SHOT=>0b0 CONTINUOUS=>0b1
28	RW	MBSEINJQ_IB_BFR_ERR_INJECT_CE: Inject a CE when performing an inband read or write operation.
29	RW	MBSEINJQ_IB_BFR_ERR_INJECT_UE: Inject a UE when performing an inband read or write operation.
30	RW	MBSEINJQ_DIRECTORY_ERR_INJECT_ADDR_PERR: Inject an Address parity error when reading the SRAM directory. Used in conjunction with directory_err_inject_mode (bit 5 of this register) to control pulse or level.
31	RW	MBSEINJQ_RRQ_POP_INJECT_POP: Inject an unexpected rrq pop to drive internal protocol error MBS FIR. Used in conjunction with directory_err_inject_mode (bit 5 of this register) to control pulse or level.
32	RW	MBSEINJQ_RRQ_POP_INJECT_PERR: Inject an error on the MBX->MBS RRQ pop interface for both MBA23 and MBA01 to set internal parity error MBS FIR.
33	RW	MBSEINJQ_SHORT_HANG_TIMER: When set, reduce the SRWPFCLN hang timer to 32 MBS cycles or 27ns
34	RW	MBSEINJQ_LRU_ERR_INJ: When set, inject an error in the lru information

Register Name	***MBC Configuration Register***
Mnemonic	MBU.MBS.MBCCFGQ
Address	000000000201140F (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBCCFGQ_CACHE_ENABLE: 1-Enable the MBC cache 0-disable the MBC cache
1	RW	MBCCFGQ_CFG_DYN_WHAP_EN: 0- whap algorithm uses programmed values for miss allocate and hit increment reference counts. 1- whap algorithm can dynamically override the programmed values for miss allocate and hit increment reference counts based on history.

Bits	SCOM	Field Mnemonic: Description
2	RW	MBCCFGQ_CLEANER_ENABLE: Turns on the cache cleaner functionality. Note that that the cleaner should not be turned on if the memory buffer is not setup to have 32KB address hashing. 00 = OFF 11 = ON
3	RW	MBCCFGQ_CACHE_ONLY_ENABLE: Special system configuration where the cache is enabled, but the DRAM is not initialized. Software is responsible that MBC does not need to perform a Castout of Modified data. If a CO is started, this mode will prevent the CO from actually making it to the MBA.
4	RW	MBCCFGQ_LRU_DMAP_EN: Enable direct mapped LRU mode. Do not set this in conjunction with lru_random_en or lru_single_mem_en.
5	RW	MBCCFGQ_LRU_RANDOM_EN: Enable random LRU mode. Do not set this in conjunction with lru_dmap_en or lru_single_mem_en.
6	RW	MBCCFGQ_LRU_SINGLE_MEM_EN: Enables only member 0 in each congruence class. Do not set this in conjunction with lru_dmap_en or lru_random_en. NOTE: there are scan only modes to disable each member on an individual basis and these modes should NOT be used in conjunction with lru_dmap_en, lru_random_en, or lru_single_mem_en. NOTE: Purge cannot be used in conjunction with this mode being set as this mode is only for hw stress.
7	RW	MBCCFGQ_CFG_SRW_DELETE_UE_EN: When set, the Shadow RW machine will line-delete a cache entry by writing to the Id state (instead of I) when purging a cache-line that experienced a cache UE.
8	RW	MBCCFGQ_SRW_LINE_DELETE_NEXT_CE_EN: When set, the Shadow RW machine will line-delete a cache entry by writing to the Id state (instead of I) during the next purge associated with a cache CE. In addition, cache_srw_ce and cache_co_ce MBSFIR bits will not be set if a cache CE is detected between setting srw_line_delete_next_ce_en and the Shadow machine performing a line delete.
9	RW	MBCCFGQ_ONLY_LOG_ECC_UE: When set, we will only log Cache UE errors. Default
10	RW	MBCCFGQ_ONLY_LOG_ECC_CE: When set, we will only log Cache CE errors
11	RW	MBCCFGQ_SRW_PREFETCH_DIS: When the cache is enabled, disable SRW machines from linking with Prefetch machines to create a 256B prefetch operation in conjunction with a down stream prefetch command.
12	RW	MBCCFGQ_PRQ_PREFETCH_DIS: Setting this bit will disable the extended prefetch engine (PRQ) regardless of the DS command encoding.
13:16	RW	MBCCFGQ_CLN_PAGE_MODE_BUNDLE_MAX_CNT_0_3: Maximum number extra cache lines bundled with the original cleaned line in a rank group transfer to MBA which map to the same DRAM page.
17:22	RW	MBCCFGQ_CLN_WRQ_TGT_ALLOC_0_5: Programmable target allocation in wrq for a given rank group. Range is from 1 to 32. Typically, will allow this to equal 8 for 8 rank group config, 16 for 4 rank group config, and 32 for 2 rank group config. Default is 8.
23:28	RW	MBCCFGQ_CLN_WR_PRIORITY_WRQ_HWMARK_0_5: Programmable hi-water mark for the cleaner shadow wrq count for write priority purposes. Indicates that a max number of wrq count has been detected for a given rank group such that there is enough work for the mba to drain a bundle when in write priority mode. Range is from 2 to cln_wrq_tgt_alloc-1. Default is 6.
29:34	RW	MBCCFGQ_CLN_WR_PRIORITY_WRQ_LWMARK_0_5: Programmable low-water mark for the cleaner shadow wrq count for write priority purposes. Indicates that a min number of wrq count has been detected for a given rank group such that the write priority signal can be dropped and mba returned to normal. Range is from 1 to cln_wr_priority_wrq_hwmark-1.Default is 4.
35:48	RW	MBCCFGQ_CLN_WR_PRIORITY_DV_HWMARK_0_13: The cleaner will tell the MBA to make writes high priority if the number of cgc's that are dirty are greater than the value stored in this field. The Cleaner will maintain this high priority write signal until the number of dirty sets goes below the value stored in MBS_cln_wr_priority_dv_lwmark. The Range is from drain_length to 8k-1, where drain_length is the difference between MBS_cln_wr_priority_dv_hwmark and MBS_cln_wr_priority_dv_lwmark. Default is 4k.
49:62	RW	MBCCFGQ_CLN_WR_PRIORITY_DV_LWMARK_0_13: Once triggerd by cln_wr_priority_dv_hwmark, the Cleaner will maintain the high priority write signal until the number of dirty sets goes below the value stored in this value. Range is from 1 to 8k-drain_length, where drain_length is the difference between MBS_cln_wr_priority_dv_hwmark and cln_wr_priority_dv_lwmark. Default is 4k-16.
63	RW	MBCCFGQ_RESERVED_63: Reserved bits that do not actually exist

Register Name	***MBC Purge Command Register***
Mnemonic	MBU.MBS.MBCPRGQ
Address	0000000002011414 (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBCPRGQ_PURGE_ENTIRE_CACHE: When bit is set, the purge engine will go through every member in the cache, cast-out the entry to DRAM if it is Dirty, and write the directory to Invalid if it was not a deleted entry, else leave the entry in the Id state. When the purge is completed, the purge_cmd_done (bit 4 of this register) will be set. NOTE: the purge_cache_start_address and purge_cache_end_address fields are ignored when purging the entire cache.
1	RW	MBCPRGQ_PURGE_CACHE_RANGE: Setting this bit will cause the purge engine to behave exactly like the purge_entire_cache command, with the exception that the purge will begin at the purge_cache_start_address and end at the purge_cache_end_address fields in this register.
2	RW	MBCPRGQ_PURGE_SINGLE_MEMBER_AND_INVALIDATE: Setting this bit will cause the purge engine to purge a specific cache entry (castout the data to DRAM if directory indicates it is Dirty), write the LRU to be MRU, and write the directory state to invalid (I). The address used for this operation needs to be written to the purge_cache_start_(member,cgc) and purge_cache_end_(member, cgc) fields of this register. NOTE: If the line was previously in the deleted state, the purge engine will maintain the deleted state after the purge.
3	RW	MBCPRGQ_PURGE_SINGLE_MEMBER_AND_DELETE: Setting this bit will cause the purge engine to purge a specific cache entry (castout the data to DRAM if directory indicates it is Dirty), write the LRU to be MRU, and write the directory state to deleted state (Id). The address for used for this operation needs to be written to the purge_cache_start_(member,cgc) and purge_cache_end_(member, cgc) fields of this register.
4:7	RW	MBCPRGQ_PURGE_CACHE_START_MEMBER: Start cache address associated with purging a range in the cache - select one of sixteen members, corresponding to address(16:19).
8:20	RW	MBCPRGQ_PURGE_CACHE_START_CGC: Start cache address associated with purging a range in the cache - select one of 8192 sets (cgcs), corresponding to address(20:32).

Bits	SCOM	Field Mnemonic: Description
21:24	RW	MBCPRGQ_PURGE_CACHE_END_MEMBER: End cache address associated with purging a range in the cache - select one of sixteen members, corresponding to address(16:19). NOTE1: Set this value must be written to the same value in the purge_cache_start_member field of this register when purging a single member. NOTE2:When purging a range, only the members from purge_cache_start_member to purge_cache_end_member will be purged in each of the cgc's in that range. If you want to purge all members, set start member to zero and end member to 0xF.
25:37	RW	MBCPRGQ_PURGE_CACHE_END_CGC: End cache address associated with purging a range in the cache - select one of 8192 sets (cgcs), corresponding to address(20:32). NOTE: Set this value must be written to the same value in the purge_cache_start_cgc field of this register when purging a single member.

Description	

Bits	SCOM	Field Mnemonic: Description
0	RW	MBSECCQ_DISABLE_MEMORY_ECC_CHECK_CORRECT: When set, memory ECC check and correct is disabled. When memory ECC checking is disabled, the SUE injecting into the 8B data bus ECC is also disabled.
1	RW	MBSECCQ_DISABLE_MEMORY_ECC_CORRECT: When set, memory ECC correct is disabled (memory ECC checking is not disabled)
2	RW	MBSECCQ_RESERVED_2: Reserved
3	RW	MBSECCQ_ENABLE_64BYTE_DATA_CHECKBIT_INVERSION: When set, even (address) 64-byte data pieces are inverted, and odd (address) 64-bytes ecc checkbits and the 65th byte are inverted, between memory and the ecc check logic, and between the ecc gen logic and memory.
4	RW	MBSECCQ_USE_MAINTENANCE_MARK: When set, maintenance read operations use the mark value in MBMMR. If a MPE is detected during a maintenance read operation and this bit is set, the mark update is written only to MBMMR. This bit must not be set for MCBIST operations.
5	RW	MBSECCQ_DISABLE_MARK_STORE_WRITE: When set, the MBMSx registers are never written by the ECC decoder hardware.
6	RW	MBSECCQ_ENABLE_FIRST_SHADOW_READ_UE: When set, the ECC checkers will ignore the state of the retry read valid and set the Memory_UE FIR bit upon first detection of a shadow read memory_ue.
7:9	RW	MBSECCQ_ECC_METADATA_MODE: Number of metadata bits in 65th byte. Values: 0_METADATA_8_CHECKBITS=>0b000 1_METADATA_7_CHECKBITS=>0b100 2_METADATA_6_CHECKBITS=>0b010 6_METADATA_2_CHECKBITS___DEFAULT_FOR_VENICE__CENTAUR__=>0b011
10	RW	MBSECCQ_SINGLE_WIRE_MODE: When set and a chipkill is marked then any new error corrected can be single wire only. (default is '1' for POWER8 processor and memory buffer)
11	RW	MBSECCQ_INT_RESET_KEEPER: When set the reset pulse will be applied to MBSECC c_err_rpt hold latches.
12	NC	MBSECCQ_INJECT_SCOM_PARITY_ERROR: When set, scom writes to any ecc scom register (except the MBSECCFIR* registers) will set incorrect parity, causing the corresponding parity error.
13	NC	MBSECCQ_INJECT_MARK_STORE_SYMBOL_PARITY_ERROR: When set, scom writes to the mark store registers MBMS0-8 will set incorrect parity for the symbol mark, causing the corresponding parity error.

Bits	SCOM	Field Mnemonic: Description
14	NC	MBSECCQ_INJECT_MARK_STORE_CHIP_PARITY_ERROR: When set, scom writes to the mark store registers MBMS0-8 will set incorrect parity for the chip mark, causing the corresponding parity error.

Description	

Bits	SCOM	Field Mnemonic: Description
0:37	RW	MBRCEICRQ_ADDRESS: Address to inject RCE. Compared with read data address. 0:2 = mrank(0:2) 3:5 = srank(0:2) 6:9 = bank(0:3) 10:26 = row(0:16) 27:37 = col(1:11)
38	RWX	MBRCEICRQ_ENABLE_RCE_INJECT: When set, a UE error is forced when the read data address matches bits (0:37) of this register, subject to the masks selected in bits 55:62. After the UE error is forced, this bit is reset. The single UE error forced causes the memory ECC logic to retry the read - since the UE error is only forced once, the retried read data will be clean, causing a RCE error to be reported.
39	RW	MBRCEICRQ_ENABLE_SCRUB_INJECT: When set, an error is injected for scrub reads when the read data address matches bits (0:37) of this register, subject to the masks selected in bits 55:62. This enable bit does not automatically reset.
40:44	RW	MBRCEICRQ_READ1_ERROR_TYPE: Selects the error to be injected for scrub read 1 (read 1 may include a retry read after an UE) The error type is a 5 bit field consisting of the following bits: R C0 S0 C1 S1 R causes a retry by causing an UE (as if C0,S0,C1,S1 are all 1) C0 causes a chip error by injecting errors in symbols 69 and 68 S0 causes a symbol error in symbol 67 C1 causes a chip error by injecting errors in symbols 37 and 36 S1 causes a symbol error in symbol 35
45:49	RW	MBRCEICRQ_READ2_ERROR_TYPE: Selects the error to be injected for scrub read 2. same bit definitions as above.
50:54	RW	MBRCEICRQ_READ3_ERROR_TYPE: Selects the error to be injected for scrub read 3. same bit definitions as above.
55:56	RW	MBRCEICRQ_BANK_MASK_SELECT: selects masking of bank bits from address compare Values: COMPARE_BANK_BITS_0_TO_3=>0b00 COMPARE_BANK_BITS_1_TO_3=>0b01 COMPARE_BANK_BITS_2_TO_3=>0b10 COMPARE_BANK_BIT_3=>0b11

60:62	RW	MBRCEICRQ_COLUMN_MASK_SELECT: selects masking of column bits from address compare Values: COMPARE_COLUMN_BITS_1_TO_11=>0b000 COMPARE_COLUMN_BITS_2_TO_11=>0b001 COMPARE_COLUMN_BITS_3_TO_11=>0b010 COMPARE_COLUMN_BITS_4_TO_11=>0b011 COMPARE_COLUMN_BITS_5_TO_11=>0b100 COMPARE_COLUMN_BITS_6_TO_11=>0b101 COMPARE_COLUMN_BITS_7_TO_11=>0b110 COMPARE_COLUMN_BITS_8_TO_11=>0b111
63	RW	MBRCEICRQ_DATAPATH_PARITY_ERROR_INJECT: When set, a datapath parity error (FIR 49) is injected for reads when the read data address matches bits (0:37) of this register, subject to the masks selected in bits 55:62. This enable bit does not automatically reset.

0	RW	MBSECCQ_DISABLE_MEMORY_ECC_CHECK_CORRECT: When set, memory ECC check and correct is disabled. When memory ECC checking is disabled, the SUE injecting into the 8B data bus ECC is also disabled.
1	RW	MBSECCQ_DISABLE_MEMORY_ECC_CORRECT: When set, memory ECC correct is disabled (memory ECC checking is not disabled)
2	RW	MBSECCQ_RESERVED_2: Reserved
3	RW	MBSECCQ_ENABLE_64BYTE_DATA_CHECKBIT_INVERSION: When set, even (address) 64-byte data pieces are inverted, and odd (address) 64-bytes ecc checkbits and the 65th byte are inverted, between memory and the ecc check logic, and between the ecc gen logic and memory.
4	RW	MBSECCQ_USE_MAINTENANCE_MARK: When set, maintenance read operations use the mark value in MBMMR. If a MPE is detected during a maintenance read operation and this bit is set, the mark update is written only to MBMMR. This bit must not be set for MCBIST operations.
5	RW	MBSECCQ_DISABLE_MARK_STORE_WRITE: When set, the MBMSx registers are never written by the ECC decoder hardware.
6	RW	MBSECCQ_ENABLE_FIRST_SHADOW_READ_UE: When set, the ECC checkers will ignore the state of the retry read valid and set the Memory_UE FIR bit upon first detection of a shadow read memory_ue.

Mnemonic	MBU.MBS.ECC23.MBRCEICRQ
Address	000000000201149D (SCOM)
Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:37	RW	MBRCEICRQ_ADDRESS: Address to inject RCE. Compared with read data address. 0:2 = mrank(0:2) 3:5 = srank(0:2) 6:9 = bank(0:3) 10:26 = row(0:16) 27:37 = col(1:11)
38	RWX	MBRCEICRQ_ENABLE_RCE_INJECT: When set, a UE error is forced when the read data address matches bits (0:37) of this register, subject to the masks selected in bits 55:62. After the UE error is forced, this bit is reset. The single UE error forced causes the memory ECC logic to retry the read - since the UE error is only forced once, the retried read data will be clean, causing a RCE error to be reported.
39	RW	MBRCEICRQ_ENABLE_SCRUB_INJECT: When set, an error is injected for scrub reads when the read data address matches bits (0:37) of this register, subject to the masks selected in bits 55:62. This enable bit does not automatically reset.
40:44	RW	MBRCEICRQ_READ1_ERROR_TYPE: Selects the error to be injected for scrub read 1 (read 1 may include a retry read after an UE) The error type is a 5 bit field consisting of the following bits: R C0 S0 C1 S1 R causes a retry by causing an UE (as if C0,S0,C1,S1 are all 1) C0 causes a chip error by injecting errors in symbols 69 and 68 S0 causes a symbol error in symbol 67 C1 causes a chip error by injecting errors in symbols 37 and 36 S1 causes a symbol error in symbol 35
45:49	RW	MBRCEICRQ_READ2_ERROR_TYPE: Selects the error to be injected for scrub read 2. same bit definitions as above.
50:54	RW	MBRCEICRQ_READ3_ERROR_TYPE: Selects the error to be injected for scrub read 3. same bit definitions as above.
55:56	RW	MBRCEICRQ_BANK_MASK_SELECT: selects masking of bank bits from address compare Values: COMPARE_BANK_BITS_0_TO_3=>0b00 COMPARE_BANK_BITS_1_TO_3=>0b01 COMPARE_BANK_BITS_2_TO_3=>0b10 COMPARE_BANK_BIT_3=>0b11
57:59	RW	MBRCEICRQ_ROW_MASK_SELECT: selects masking of row bits from address compare Values: COMPARE_ROW_BITS_0_TO_16=>0b000 COMPARE_ROW_BITS_1_TO_16=>0b001 COMPARE_ROW_BITS_2_TO_16=>0b010 COMPARE_ROW_BITS_3_TO_16=>0b011 COMPARE_ROW_BITS_4_TO_16=>0b100 COMPARE_ROW_BITS_5_TO_16=>0b101 COMPARE_ROW_BITS_6_TO_16=>0b110 COMPARE_ROW_BITS_7_TO_16=>0b111
60:62	RW	MBRCEICRQ_COLUMN_MASK_SELECT: selects masking of column bits from address compare Values: COMPARE_COLUMN_BITS_1_TO_11=>0b000 COMPARE_COLUMN_BITS_2_TO_11=>0b001 COMPARE_COLUMN_BITS_3_TO_11=>0b010 COMPARE_COLUMN_BITS_4_TO_11=>0b011 COMPARE_COLUMN_BITS_5_TO_11=>0b100 COMPARE_COLUMN_BITS_6_TO_11=>0b101 COMPARE_COLUMN_BITS_7_TO_11=>0b110 COMPARE_COLUMN_BITS_8_TO_11=>0b111
63	RW	MBRCEICRQ_DATAPATH_PARITY_ERROR_INJECT: When set, a datapath parity error (FIR 49) is injected for reads when the read data address matches bits (0:37) of this register, subject to the masks selected in bits 55:62. This enable bit does not automatically reset.

Attributes	
Description	

Bits	SCOM	Field Mnemonic: Description
0:7	RW	SCAC_I2CMCTRL_I2CCMD: The value that will be sent to I2CM Control Register, bits 0-7 to request the I2C Read of the sensor. Should be set to 10010010, indicating a read with stop and no address or continue.
8:11	RW	SCAC_I2CMCTRL_I2CSEGMENT: The value that will be sent to I2CM Control register, bits 8-11 to request the I2C Read of the sensor. This field contains the device address of the sensor. The actual sensor number will be appended to bits 12:14 by the hardware automatically. This value will be asserted as A6,A5,A4,A3 during the address phase of the I2C transaction. This should normally be set to 0011.
12:14	RW	SCAC_I2CMCTRL_SPARE1: The hardware will automatically put the specific target sensor address into I2CM control register bits 12:14 completing the I2C device 7-bits address field. This will become A2,A1,A0 during the address phase of the I2C transaction. This actual register is does nothing and is just a placeholder for commonality.
15	RW	SCAC_I2CMCTRL_I2CRNW: The value that will be sent to I2CM Control Register bits 15 to request the I2C Read of the sensor. This field contains the read request and should be set to '1'.
16:17	RW	SCAC_I2CMCTRL_I2CSPEED: The value that will be sent to I2CM Contr0l Register bits 16:17 to request the I2C Read of the sensor. This field contains the I2C clock speed. It should be set to 01 00 : 100Khz 01 : 400Khz 10 : 3400Khz 11 : 50Khz.
18:22	RW	SCAC_I2CMCTRL_I2CPORT: The value that will be sent to I2CM Contr0l Register bits 18:22 to request the I2C Read of the sensor. This field contains the PIB Control Register Port Number.
23:24	RW	SCAC_I2CMCTRL_I2CADRLEN: The value that will be sent to I2CM Contr0l Register bits 24:25 to request the I2C Read of the sensor. This field contains the Register Address length and should be set to 00. Bit 23 of the I2CM Control Register is unused.
25	RW	SCAC_I2CMCTRL_I2CENHANCED: The value that will be sent to I2CM Contr0l Register bits 26 to request the I2C Read of the sensor. This field contains the I2CM Enhanced Mode setting and should be set to 0.
26:27	RW	SCAC_I2CMCTRL_CTRLOFFSET: Offset from PibTarget where the I2CM control register is. Should be set to 00
28:29	RW	SCAC_I2CMCTRL_STATOFFSET: Offset from PibTarget where the I2CM status register is. Should be set to 10
30:31	RW	SCAC_I2CMCTRL_RESETOFFSET: Offset from PibTarget where the I2CM reset register is. Should be set to 01

53	RWX	MBSTRQ_RESET_ALL_ERROR_COUNT_REGISTERS: Reset all error count and symbol error count registers Set to clear registers. Hardware will reset this bit to zero after registers are cleared.
54	RWX	MBSTRQ_DISABLE_RESET_ERROR_REG_RANK_END: Disable reset of error count and symbol error count registers at end of rank When set, the se registers will not be reset at the end of a rank. When this bit is reset to zero, the error registers will be reset when the end of a rank is reached and the MBMACA address has incremented to the next valid rank during execution of a multi-address command. Note: The only way to clear the count and syndrome registers is by setting bit 11 above or incrementing the MBMACA address past the end of a rank during a multi-address command. Starting and stopping scrubs will NOT reset these registers.
55	RWX	MBSTRQ_SOFT_CE_INCR_SYMBOL_COUNT: soft ce increment symbol counters When set, a soft CE detected by a readscrub op will increment one of the 72 8-bit a symbol error counters

Bits	SCOM	Field Mnemonic: Description
53	RWX	MBSTRQ_RESET_ALL_ERROR_COUNT_REGISTERS: Reset all error count and symbol error count registers Set to clear registers. Hardware will reset this bit to zero after registers are cleared.
54	RWX	MBSTRQ_DISABLE_RESET_ERROR_REG_RANK_END: Disable reset of error count and symbol error count registers at end of rank When set, the se registers will not be reset at the end of a rank. When this bit is reset to zero, the error registers will be reset when the end of a rank is reached and the MBMACA address has incremented to the next valid rank during execution of a multi-address command. Note: The only way to clear the count and syndrome registers is by setting bit 11 above or incrementing the MBMACA address past the end of a rank during a multi-address command. Starting and stopping scrubs will NOT reset these registers.
55	RWX	MBSTRQ_SOFT_CE_INCR_SYMBOL_COUNT: soft ce increment symbol counters When set, a soft CE detected by a readscrub op will increment one of the 72 8-bit a symbol error counters
56	RWX	MBSTRQ_INTERMIT_INCR_SYMBOL_COUNT: intermittent ce increment symbol counters When set, an intermittent CE detected by a readscrub op will increment one of the 72 8-bit symbol error counters
57	RWX	MBSTRQ_HARD_CE_INCR_SYMBOL_COUNT: Hard ce increment symbol counters When set, a hard CE detected by a readscrub op will increment one of the 72 8-bit a symbol error counters
58	RWX	MBSTRQ_MCE_INCR_SYMBOL_COUNT: MCE increment symbol count (but would need to split out failed symbol info from chip mark....TBD, extra credit)
59	RWX	MBSTRQ_UE_TRAP: Trap data only with UEs enabled When set, only read data with UEs will be saved in the Maint buffers. When not set, all data from a read will be saved into the Maint buffers regardless if it had an error or not.

Bits	SCOM	Field Mnemonic: Description
0:55	RWX	MBSEVRQ_ERR_VECTOR0: Error Vector 0 This is the 56-bit error vector associated with the last memory error detected. 0:7 - E1 8:15 - E2 16:23 - E3 24:31 - E4 32:39 - E 40:47 - R 48:55 - Error Mask E1 is the error magnitude for the symbol pointed to by the mark x1 E2 is the error magnitude for the symbol pointed to by the mark x2 E3 is the error magnitude for the symbol pointed to by the mark x3 E4 is the error magnitude for the symbol pointed to by the mark x4 E is the error magnitude for a NEW error (associated with NCE) R is the error location, coded as a Galois Field index, for the new error (associated with NCE) Error Mask is the 8bit xor mask that indicates which bits in the corrected symbol were flipped in order to the correct the SCE

Description	

Bits	PCB	Field Mnemonic: Description
0	RW	ISLE_XSTOP_MASK_B: mask for clockstop of all island clocks on xstop from chiplet
1	RW	PCB_XSTOP_MASK_B: mask for clockstop of all island clocks on xstop from pcb
2	RW	CLKSTP_SYNC_EN: stop clocks aligned to sync pulse
3	RW	EDRAM_XSTOP_MASK_B: mask for clockstop of eDRAM clock on any xstop
4	RW	PLL_XSTOP_MASK_B: mask for clockstop of pll clock on any xstop
5	RW	LOCAL_XSTOP_MASK_B: mask for clockstop of all island clocks on local xstop from chiplet
6	RW	DISABLE_PCB_ITR: disable interrupt generation within CC
7	RW	USE_SYNC_FOR_SCAN: if set, use opcg initial alignment for scan requests
8	RW	KEEP_EDRAM_ON_XSTOP: keep eDRAM enabled when a checkstop occurs
9	RW	TRIGGER_OPCG_ON_XSTOP: trigger opcg on xstop instead of performing clockstop
10	RW	SEL_EXT_OPCG_TRIGGER: select external OPCG trigger (set OPCG in slave mode)
11	RW	LISTEN_TO_SYNC_PULSE: enable phase counter synchronization by sync_pulse signal
12	RW	SYNC_CLK_START_ENABLE: enable clk start driven by tc_sync_clk_stop (falling edge)
13	RW	SYNC_CLK_STOP_ENABLE: enable clk stop driven by tc_sync_clk_stop (rising_edge)
14	RWX_WOR	CHIP_PROTECTION_ENABLE: memory buffer only - can only be set, but not cleared via PCB. When this bit is SET, no clock starts are possible

Description	

Bits	PCB	Field Mnemonic: Description
0:11	RW	SCAN_COUNT: BIST mode: Channel scan count (s = 0-4095) runn-mode: start_abist match value(0:11)
12:23	RW	MISR_A_VAL: BIST mode: a value for MISR aperture, runn-mode: start_abist match value(12:23)
24:35	RW	MISR_B_VAL: BIST mode: b value for MISR aperture, runn-mode: start_abist match value(24:35)
36:47	RW	MISR_INIT_WAIT: BIST mode: delay MISR aperture, MISRs get active after this number of loops
48	RW	SCAN_CLK_USE_EVEN: BIST mode: Generate scan clock in f odd cycle. runn-mode: run one additional clock in f domain
49:51	RW	OPCG_PAD_VALUE: After setting all DC signals, wait this many number of cycle x 16 before applying tholds
52	RW	USE_F_AND_FDIV2: BIST mode: if 1, use 8 f and 4 f/2 pattern concurrently, else use 1-12 local mesh patterns
53	RW	USE_ARY_CLK_DURING_FILL: BIST mode: Fire nsl_ary_clock during NSL-fill runn-mode: stop run-n on xstop
54	RW	SG_HIGH_DURING_FILL: BIST mode: Hold SG high during NSL-fill and SNOP runn-mode: OPCG engine controls start_abist (overrides GP0 setting)
55	RW	RTIM_THOLD_FORCE: force rtim_thold low when not in test_dc mode (must be 0 at all time)
56	RW	LBIST_SKITTER_CTL: BIST mode: 0: enable skitter during lbist_ip, 1: enable skitter when misr_active
57	RW	MISR_MODE: BIST mode: MISR aperture mode (0: a-1 to b-1, 1: start to a and b to end)
58	RW	INFINITE_MODE: infinite mode
59:63	RW	NSL_FILL_COUNT: BIST mode: NSL-fill count (0-31)

Register Name	*Chiplet Heartbeat Register*
Mnemonic	TPTOP.NET.PCBSLNEST.HEARTBEAT_REG
Address	00000000020F0018 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	HEARTBEAT_DEAD: Chiplet heartbeat not detected

Register Name	*Lock Indications From PLLs*
Mnemonic	TPTOP.NET.PCBSLNEST.PLL_LOCK_REG
Address	00000000020F0019 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:3	ROX	Reserved field. (Access type is lock)

Register Name	*Attn Interrupt*
Mnemonic	TPTOP.NET.PCBSLNEST.ATTN_INTERRUPT_REG
Address	00000000020F001A (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	Reserved field. (Access type is attn)

Register Name	*Recov Interrupt*
Mnemonic	TPTOP.NET.PCBSLNEST.RECOV_INTERRUPT_REG
Address	00000000020F001B (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	Reserved field. (Access type is recov)

Register Name	*Xstop Interrupt*
Mnemonic	TPTOP.NET.PCBSLNEST.XSTOP_INTERRUPT_REG
Address	00000000020F001C (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	ROX	Reserved field. (Access type is xstop)

Register Name	*Slave Config Register*
Mnemonic	TPTOP.NET.PCBSLNEST.SLAVE_CONFIG_REG
Address	00000000020F001E (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	CFG_DISABLE_PERV_THOLD_CHECK: Disable pervasive thold check
1	RW	CFG_DISABLE_MALF_PULSE_GEN: Disable pulse generation for malf alert. Switch back to level
2	RW	CFG_STOP_HANG_CNT_SYS_XSTP: Disable hang counter stop for system xstop
3	RW	CFG_DISABLE_CL_ATOMIC_LOCK: Disable atomic lock for chiplet accesses
4	RW	CFG_DISABLE_HEARTBEAT: Disable check for voltage and gridclock in the chiplet
5:7	RW	
8:12	RW	ERROR_MASK: mask bits for slave error reporting

Bits	PCB	Field Mnemonic: Description
13:15	RW	

Register Name	*Error Capture Register*
Mnemonic	TPTOP.NET.PCBSLNEST.ERROR_REG
Address	00000000020F001F (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RWX_WCLEAR	CE_ERROR: Correctable error on pcb bus
1:3	RWX_WCLEAR	CHIPLET_ERRORS: Errors reported by chiplet 000 = no error 001 = XSCOM command blocked due pending errors 010 chiplet offline 011 partial good 100 invalid address / address error / bad access type 101 clock error 110 parity error / received unexpected packet / wrong packet number 111 timeout This register is for debug purposes only. It only holds meaningful data if it is cleared after each error.
4	RWX_WCLEAR	PARITY_ERROR: Parity error on PCB Interface
5	RWX_WCLEAR	DATA_BUFFER_ERROR: Parity error in data buffer
6	RWX_WCLEAR	ADDR_BUFFER_ERROR: Parity error in address buffer
7	RWX_WCLEAR	PCB_FSM_ERROR: Invalid state error in PCB FSM
8	RWX_WCLEAR	CL_FSM_ERROR: Invalid state error in Chiplet FSM
9	RWX_WCLEAR	INT_RX_FSM_ERROR: Invalid state error in interrupt RX FSM
10	RWX_WCLEAR	INT_TX_FSM_ERROR: Invalid state error in interrupt TX FSM
11	RWX_WCLEAR	INT_TYPE_ERROR: Invalid interrupt type
12	RWX_WCLEAR	CL_DATA_ERROR: Parity error on Chiplet Interface
13	RWX_WCLEAR	INFO_ERROR: Parity error on Chiplet info lines
14	RWX_WCLEAR	UNUSED_0:
15	RWX_WCLEAR	CHIPLET_ATOMIC_LOCK_ERROR: Chiplet atomic lock error
16	RWX_WCLEAR	PCB_INTERFACE_ERROR: Error of pcb interface component for the internal endpoint
17	RWX_WCLEAR	CHIPLET_OFFLINE: Heartbeat check indicated that chiplet is offline
18	RWX_WCLEAR	CHIPLET_GRID_SKITTER: Heartbeat check indicated skitter on the chiplet grid
19	RWX_WCLEAR	GP3_REG_PARITY_ERROR: gp3 register parity bad
20	RWX_WCLEAR	ADDRESS_REG_PARITY_ERROR: address register parity bad

Bits	PCB	Field Mnemonic: Description
21	RWX_WCLEAR	TIMEOUT_REG_PARITY_ERROR: timeout select register parity bad
22	RWX_WCLEAR	CONFIG_REG_PARITY_ERROR: slave config register parity bad
23	RWX_WCLEAR	CLK_ADJ_REG_PARITY_ERROR: clk adj register parity bad
24	RWX_WCLEAR	DIV_REG_PARITY_ERROR: div register parity bad
25:28	RWX_WCLEAR	PLL_UNLOCK_ERROR: unlock from chiplet pll

Register Name	***Hang Pulse Generation Register 0***
Mnemonic	TPTOP.NET.PCBSLNEST.HANG_PULSE_0_REG
Address	00000000020F0020 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_0: Value of hang pulse 0. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_0: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	***Hang Pulse Generation Register 1***
Mnemonic	TPTOP.NET.PCBSLNEST.HANG_PULSE_1_REG
Address	00000000020F0021 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_1: Value of hang pulse 1. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_1: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	***Hang Pulse Generation Register 2***
Mnemonic	TPTOP.NET.PCBSLNEST.HANG_PULSE_2_REG
Address	00000000020F0022 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_2: Value of hang pulse 2. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_2: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	*Hang Pulse Generation Register 3*
Mnemonic	TPTOP.NET.PCBSLNEST.HANG_PULSE_3_REG
Address	00000000020F0023 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_3: Value of hang pulse 3. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_3: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	*Hang Pulse Generation Register 4*
Mnemonic	TPTOP.NET.PCBSLNEST.HANG_PULSE_4_REG
Address	00000000020F0024 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_4: Value of hang pulse 4. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_4: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	*Hang Pulse Generation Register 5*
Mnemonic	TPTOP.NET.PCBSLNEST.HANG_PULSE_5_REG
Address	00000000020F0025 (PCB)
Attributes	
Description	This hang counter is exclusively used to generate the malfunction alert pulse

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_5: Value of hang pulse 5. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_5: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	*Hang Pulse Generation Register 6*
Mnemonic	TPTOP.NET.PCBSLNEST.HANG_PULSE_6_REG
Address	00000000020F0026 (PCB)
Attributes	
Description	This hang counter is exclusively used for the heartbeat generation

Bits	PCB	Field Mnemonic: Description
0:5	RW	HANG_PULSE_REG_6: Value of hang pulse 6. Time period = 2^value * (precounter_reg+1) / pcb_freq, 34>=value>0
6	RW	SUPPRESS_HANG_6: If set to '1', hang pulses are suppressed in case of a xstop

Register Name	***Divider For Hang Counter Clock***
Mnemonic	TPTOP.NET.PCBSLNEST.PRE_COUNTER_REG
Address	00000000020F0028 (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0:7	RW	PRE_COUNTER: Divider for hang counter clock. Divides clock by n+1 (default: n=0)

Register Name	***Protect Mode Register***
Mnemonic	TPTOP.NET.PCBSLNEST.PROTECT_MODE_REG
Address	00000000020F03FE (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	READ_PROTECT_ENABLE: Enable read protection
1	RW	WRITE_PROTECT_ENABLE: Enable write protection

Register Name	***Atomic Lock Register***
Mnemonic	TPTOP.NET.PCBSLNEST.ATOMIC_LOCK_REG
Address	00000000020F03FF (PCB)
Attributes	
Description	

Bits	PCB	Field Mnemonic: Description
0	RW	ATOMIC_LOCK_ENABLE: Enable atomic lock
1:4	ROX	ATOMIC_ID: Atomic ID

4. PCB Slave 2: DMI Indirect Registers

The memory buffer registers are listed alphabetically by mnemonic in the following address table.

0:47	RO	constant=0b000000000000000000000000000000000000000000000000

Bits	SCOM	Field Mnemonic: Description
48	RWX	RX_LANE_PDWN: Used to receive inhibit and fully power down a lane independent of the logical lane disable. This control is independent from the per-group logical lane disable settings (rx_lane_disable_vec*) in order to allow for flexibility. Note that this control routes through the boundary scan logic, which has dominance. Also note that per-group registers rx_lane_disabled_vec_0_15 and rx_lane_disabled_vec_16_31 are used to logically disable a lane with respect to the training, recalibration, and repair machines so both this per-lane and the per-group registers need to be set in order to logically disable and power down a lane. Note that this per-lane register is adjusted for lane swizzling automatically in HW but it is NOT adjusted automatically in HW when in the MSB-LSB swap mode so the eRepair procedure needs to take care to power down the correct lane when in this mode. 0b0 = Lane Powered Up (default) 0b1 = Lane Receive Inhibited and Powered Down. The lane_disable_vec_* per-group registers configure the state machine but do not automatically power down or tristate the lanes. DEBUG NOTE: You have to account for swizzle when correlating the per-pack latch to the per-group latch setting. Values: ENABLED=>0b0 DISABLED=>0b1
49:53	RO	constant=0b00000 Values: ENABLED=>0b0 DISABLED=>0b1
54	RWX	RX_LANE_SCRAMBLE_DISABLE: Used to disable the RX descrambler on a specific lane or all lanes by using a per-lane/per-group global write.
55:63	RO	constant=0b000000000

Note that this control routes through the boundary scan logic, which has dominance. Also note that per-group registers rx_lane_disabled_vec_0_15 and rx_lane_disabled_vec_16_31 are used to logically disable a lane with respect to the training, recalibration, and repair machines so both this per-lane and the per-group registers need to be set in order to logically disable and powerdown a lane. Note that this per-lane register is adjusted for lane swizzling automatically in HW but it is NOT adjusted automatically in HW when in the MSB-LSB swap mode so the eRepair procedure needs to take care to power down the correct lane when in this mode. 0b0 = Lane Powered Up (default) 0b1 = Lane Receive Inhibited and Powered Down. The lane_disable_vec_* per-group registers configure the state machine but do not automatically power down or tristate the lanes. DEBUG NOTE: You have to account for swizzle when correlating the per-pack latch to the per-group latch setting. Values: ENABLED=>0b0 DISABLED=>0b1

Bits	SCOM	Field Mnemonic: Description
48	RWX	RX_LANE_PDWN: Used to receive inhibit and fully power down a lane independent of the logical lane disable. This control is independent from the per-group logical lane disable settings (rx_lane_disable_vec*) in order to allow for flexibility. Note that this control routes through the boundary scan logic, which has dominance. Also note that per-group registers rx_lane_disabled_vec_0_15 and rx_lane_disabled_vec_16_31 are used to logically disable a lane with respect to the training, recalibration, and repair machines so both this per-lane and the per-group registers need to be set in order to logically disable and power down a lane. Note that this per-lane register is adjusted for lane swizzling automatically in HW but it is NOT adjusted automatically in HW when in the MSB-LSB swap mode so the eRepair procedure needs to take care to power down the correct lane when in this mode. 0b0 = Lane Powered Up (default) 0b1 = Lane Receive Inhibited and Powered Down. The lane_disable_vec_* per-group registers configure the state machine but do not automatically power down or tristate the lanes. DEBUG NOTE: You have to account for swizzle when correlating the per-pack latch to the per-group latch setting. Values: ENABLED=>0b0 DISABLED=>0b1

54	RWX	RX_LANE_SCRAMBLE_DISABLE: Used to disable the RX descrambler on a specific lane or all lanes by using a per-lane/per-group global write.

48	RWX	TX_LANE_PDWN: Used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. This control is independent from the per-group logical lane disable settings (tx_lane_disable_vec*) in order to allow for flexibility. Note that this control routes through the boundary scan logic, which has dominance. Also note that per-group registers tx_lane_disabled_vec_0_15 and tx_lane_disabled_vec_16_31 are used to logically disable a lane with respect to the training, recalibration, and repair machines so both this per-lane and the per-group registers need to be set in order to logically disable and powerdown a lane. Note that this per-lane register is adjusted for lane swizzling automatically in HW but it is NOT adjusted automatically in HW when in the MSB-LSB swap mode so the eRepair procedure needs to take care to power down the correct lane when in this mode. 0b0 = Lane Powered Up (default) 0b1 = Lane Drive Inhibited (Tristated) and Powered Down. The lane_disable_vec_* per-group registers configure the state machine but do not automatically power down or tristate the lanes. DEBUG NOTE: You have to account for swizzle when correlating the per-pack latch to the per-group latch setting. Values: ENABLED=>0b0 DISABLED=>0b1

48	RWX	TX_LANE_PDWN: Used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. This control is independent from the per-group logical lane disable settings (tx_lane_disable_vec*) in order to allow for flexibility. Note that this control routes through the boundary scan logic, which has dominance. Also note that per-group registers tx_lane_disabled_vec_0_15 and tx_lane_disabled_vec_16_31 are used to logically disable a lane with respect to the training, recalibration, and repair machines so both this per-lane and the per-group registers need to be set in order to logically disable and powerdown a lane. Note that this per-lane register is adjusted for lane swizzling automatically in HW but it is NOT adjusted automatically in HW when in the MSB-LSB swap mode so the eRepair procedure needs to take care to power down the correct lane when in this mode. 0b0 = Lane Powered Up (default) 0b1 = Lane Drive Inhibited (Tristated) and Powered Down. The lane_disable_vec_* per-group registers configure the state machine but do not automatically power down or tristate the lanes. DEBUG NOTE: You have to account for swizzle when correlating the per-pack latch to the per-group latch setting. Values: ENABLED=>0b0 DISABLED=>0b1
49	RWX	TX_LANE_INVERT: Used to invert the polarity of a lane. 0b0 = Normal Lane Polarity (default) 0b1 = Lane Inverted. Values: NORMAL=>0b0 INVERTED=>0b1

48	RWX	TX_LANE_PDWN: Used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. This control is independent from the per-group logical lane disable settings (tx_lane_disable_vec*) in order to allow for flexibility. Note that this control routes through the boundary scan logic, which has dominance. Also note that per-group registers tx_lane_disabled_vec_0_15 and tx_lane_disabled_vec_16_31 are used to logically disable a lane with respect to the training, recalibration, and repair machines so both this per-lane and the per-group registers need to be set in order to logically disable and powerdown a lane. Note that this per-lane register is adjusted for lane swizzling automatically in HW but it is NOT adjusted automatically in HW when in the MSB-LSB swap mode so the eRepair procedure needs to take care to power down the correct lane when in this mode. 0b0 = Lane Powered Up (default) 0b1 = Lane Drive Inhibited (Tristated) and Powered Down. The lane_disable_vec_* per-group registers configure the state machine but do not automatically power down or tristate the lanes. DEBUG NOTE: You have to account for swizzle when correlating the per-pack latch to the per-group latch setting. Values: ENABLED=>0b0 DISABLED=>0b1

Bits	SCOM	Field Mnemonic: Description
0:47	RO	constant=0b000000000000000000000000000000000000000000000000
48	RWX	TX_LANE_PDWN: Used to drive inhibit (tristate) and fully power down a lane independent of the logical lane disable. This control is independent from the per-group logical lane disable settings (tx_lane_disable_vec*) in order to allow for flexibility. Note that this control routes through the boundary scan logic, which has dominance. Also note that per-group registers tx_lane_disabled_vec_0_15 and tx_lane_disabled_vec_16_31 are used to logically disable a lane with respect to the training, recalibration, and repair machines so both this per-lane and the per-group registers need to be set in order to logically disable and powerdown a lane. Note that this per-lane register is adjusted for lane swizzling automatically in HW but it is NOT adjusted automatically in HW when in the MSB-LSB swap mode so the eRepair procedure needs to take care to power down the correct lane when in this mode. 0b0 = Lane Powered Up (default) 0b1 = Lane Drive Inhibited (Tristated) and Powered Down. The lane_disable_vec_* per-group registers configure the state machine but do not automatically power down or tristate the lanes. DEBUG NOTE: You have to account for swizzle when correlating the per-pack latch to the per-group latch setting. Values: ENABLED=>0b0 DISABLED=>0b1

Bits	SCOM	Field Mnemonic: Description
49	RWX	TX_LANE_INVERT: Used to invert the polarity of a lane. 0b0 = Normal Lane Polarity (default) 0b1 = Lane Inverted. Values: NORMAL=>0b0 INVERTED=>0b1
50:51	RWX	TX_LANE_QUIESCE_P: Used to force the output of the positive differential leg of a lane to a particular value. 0b00 = Functional Data (default) 0b01 = Quiesce Lane to a Static 0 value 0b10 = Quiesce Lane to a Static 1 value 0b11 = Tri-State Lane Output. Values: FUNCTIONAL=>0b00 QUIESCE_TO_0=>0b01 QUIESCE_TO_1=>0b10 QUIESCE_TO_Z=>0b11
